I decided on a MOPA for my next project and in doing some research ran across a nice article in QST called "More Power With Better Frequency Stability". I scanned and OCR'd it for readability and thought others might like it so here it is.

Hi Guys,

Speaking of MOPAS, here's the schematic of the 227 MOPA that I have successfully used here in 2 - 3 past BK events...

Note that I put TWO 227s in parallel in the final, vs. just the one, for twice the power input.

Hi Steve,

Thanks for the FB note...

Well, I don't dare put more than 250 VDC on those plates, & the combined dual plate current---on a good say---is something like 40 - 45 ma., so the final input power for a pair is around 10-watts...

At around 60% efficiency, that'd translate to about 6-watts RF output power.

In my rig I deleted the VR circuitry when I discovered that it was mysteriously affecting the frequency stability of the signal---it would suddenly jump around for no obvious reason, & rather than trouble-shooting the root cause, I simply ripped it out. The sig sounded chirpy either way---but this IS 1929, after all, so what the heck, right...?! :o)

sounds just about right and a very inexpensive way to get a '29 rig with some decent power on the air. The 27's are prety easy to find.

>The sig sounded chirpy either way---but this IS 1929, after all, so what
>the heck, right...?! :o)

I love chirp but I sure don't like the jumping around when antennas blow in the wind. I am thinking once again about building an amplifier for the Hull Hartley to remove my BK windy-night angst that I go through each time....probably a single '10'. I have considered a completely new build, with oscillator and PA but since I have a perfectly good Hull Hartley, why not just use that to drive a new PA only.

Hi Steve,

Well, that's certainly a HUGE advantage---to me as well, at any rate---over using a MOPA vs. a self-oscillating rig, i.e. no wind "wobbulation" to detract from an otherwise "pristine" 1929-style signal...

...And yes, those 227s are STILL plentiful & relatively cheap---only don't force-feed them with anything more than 250-VDC! I once did just that, with some 350-VDC, & saw small chunks of glowing plate material spewing off of the thing to the bottom of the envelope!

Like everything else, I guess---"IN MODERATION", Hi Hi

Date: 2014-01-02 03:25:44 UTC
From: Ron Barlow
Topic: 9029 Message: 9054

Hi Steve,

Thanks again for sharing the results of your interesting experiments!

I am surprised that adding only 100 ohms to a ~ 2000 ohm grid leak caused a 7% power out reduction.

I did not realize that you had a DVM. Perhaps a ~ 10 ohm resistor, instead of 100 ohms, while using the millivolt range on the DVM would have resulted in a negligible amount of power reduction & would have been a better recommendation.

Subject: RE: [AWA Group] 841 Hartley experiments

>observe both the plate current and the power output, before and after attaching the meter. If either measurement changes significantly, the addition of the meter has affected the oscillator performance,

OK, I gave that a try. The presence of the leads is having an effect. I tried two modern DVM's (Fluke 27 and Extech 330).

Leads' location	Parameter	Fluke	Extech
Grid to C.T.	Power Out	Down 61%	Down 7%
	Plate current	Down 28%	Down 4%
Across grid resistor	Power Out	Down 15%	Down 8%
	Plate current	Up 3%	Up 2%

>break the connection between the tap on L-2, and the two C-5 (2000 pf) capacitors. Install a temporary .01 mfd mica or disc ceramic capacitor, shunted with a 100 ohm resistor across the open circuit that you just created. Now, apply power to the oscillator, and measure the voltage drop across the 100 ohm resistor.

OK, did that.

Use a meter that will not be affected by RF, and locate the meter at least a couple of feet away from the Hartley. (You could add Rf chokes in the leads to the meter, at the meter end of the meter leads, and another .01 mfd cap, at the meter tereminals, to eliminate the affects of RF, on the meter reading).

Not sure how RF-immune my meters really are, so I used the chokes and additional bypass cap. At least with this method, there was no change in plate current between leads attached/disconnected across the 100-ohm/.01uF. However, there was a 7% difference in power output. As far as grid voltage and current readings, I came up with consistently

higher readings for both using your metering method.

Thanks Ron!

Thanks Doug!

I've read that article several times since I discovered it two years ago. Although the article was published in 1931, I see no reason why some of the MOPA designs suggested could not be considered "1929" so long as the tubes are chosen appropriately. It could have been done in 1929, probably even was done. I was looking really hard at the screen grid tubes as a possible add-on for my UX-210 TNT. I have a UX-865 and a UX-860. One note on the article: I assume the suggested C3 voltage rating for the '65 and '60 amplifier tubes in the table of constants was put there in error. The screen grid tubes aren't supposed to need neutralizing, and C3 isn't shown on that schematic.

I've abandoned plans to build another stage / MOPA but it would have been a fun thing to build and operate!

Happy 2014 everyone!

From: Steve Flood
Topic: 9047 Message: 9062

Something also to note if anyone proceeds with Grammer's MOPA information:

The -45v grid bias for the 10 and 865 tubes noted in the table are not nearly enough to produce cutoff.

Jim W8KGI noted this in an article in Electric Radio (June 2011) for his 10-10 MOPA build, and I found it was also true when building my 45-865 MOPA. Jim used -100v for the 10, and I used -90v for the 865. I made my bias adjustable from the bias supply with a 10k pot instead of 10k fixed resistance, the only reason being so that I could find the exact voltage where plate cutoff occurred while test-bedding.

With only -45 bias, I was running 10mA of zero-signal plate current (standby), and getting 49% PA efficiency. (Class AB2 I presume?).

Adjusting bias right at cutoff was around 60% efficiency.

With -90v bias, I was well past cutoff and got 70% efficiency. (Class C?)

The 31 handbook does show -50v for Class B and -100v for Class C operation.

Steve, KK7UV

9063. RE: [AWA Group] new project MOPA

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-01-02 19:31:36 UTC
From: Steve Flood
Topic: 9047 Message: 9063

...I forgot to add that there is nothing wrong with AB2 operation of the PA.

It is supposed to be more "linear" and probably translates to cleaner sigs and less harmonics.

The lower efficiency will probably mean that there minimal gain in power output over just running the oscillator, but at the greatly added benefit of isolating the oscillator from Mayne Island winds.

- KK7UV

9064. MOPAs are Valid for 1929 QSO Party

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-01-02 19:01:32 UTC
From: whitebear1122@...
Topic: 9047 Message: 9064

MOPA's are valid for the 1929 QSO Party no matter when the article was published as long as the oscillator is self excited and the tubes were available in 1929 or earlier. My first 29 transmitter was a MOPA, a 27 Hartley driving a pair of 27's in parallel. For the past several years I've been using push-pull Colpitts with a pair of 10's. I'm thinking of building a new transmitter for the next few years, maybe a MOPA with a Colpitts oscillator driving a 211 or just a single tube Colpitts with the 211.

Does anyone know what this gizmo is for? Standard Bud 4-pin plug-in coil form with 4-pin socket attached to top and SPDT toggle switch on the side. Eyelet attachment of socket to small L-brackets which are eyeleted to the sides of the form suggests factory made. Something inside with 1K resistance can be switched from pin 2 on the bottom to pin 2 or 3 on the top. The large pins, 1 and 4, run straight through bottom to top. Pin 3 on bottom is not connected. What was this possibly used for?

Subject: [AWA Group] Gizmo [1 Attachment]

Does anyone know what this gizmo is for? Standard Bud 4-pin plug-in coil form with 4-pin socket attached to top and SPDT toggle switch on the side. Eyelet attachment of socket to small L-brackets which are eyeleted to the sides of the form suggests factory made. Something inside with 1K resistance can be switched from pin 2 on the bottom to pin 2 or 3 on the top. The large pins, 1 and 4, run straight through bottom to top. Pin 3 on bottom is not connected. What was this possibly used for?
Mike, W6MAB

I am glad to learn that you still apparently have electrical svc., up there, despite the storms, Paul!

If I understand correctly, the vintage of the circuit design is the defining parameter. Therefore, for example, the pre 1930 oscillator circuit designs (Hartley, Colpitts, TNT, TPTG, Meissner, etc.) are "legal", but the ECO (Electron Coupled Oscillator) is not, as it is a post 29 (1931??) innovation.

I guess that my "thinking" is inverted! I started out with a MOPA, and decided that (in my view) a single stage QRP Hartley xmtr. seemed like it would be more in the "spirit" of things, and more fun. After several years of use, the Hartleys are still in use!

Subject: Re: [AWA Group] new project MOPA

Thanks Doug!

I've read that article several times since I discovered it two years ago. Although the article was published in 1931, I see no reason why some of the MOPA designs suggested could not be considered "1929" so long as the tubes are chosen appropriately. It could have been done in 1929, probably even was done. I waslooking really hard at the screen grid tubes as a possible add-on for my UX-210 TNT. I have a UX-865 and a UX-860. One note on the article: I assume the suggested C3 voltage rating for the '65 and '60 amplifier tubes in the table of constants was put there in error. The screen grid tubes aren't supposed to need neutralizing, and C3 isn't shown on that schematic.

I've abandoned plans to build another stage / MOPA but it would have been a fun thing to build and operate!

Happy 2014 everyone!

Hi Ron, and all...

So far, no power outages here! But we are having something of an "old fashioned" winter after many years of mild ones. As of 10:00 AM today I had light snow, -11°F, wind 5-10 gusting 15mph. Just another day in paradise?

I take your point about the simple self excited oscillator seeming more in the "spirit" of things, at least as far as the Bruce Kelley is concerned. I'm afraid I fell in love with the classic appearance of the old time rigs. I have to admit, more than any other consideration, appearance was the attraction for me. For 30 years I had paused to stare at photographs of 1920s rigs wherever I found them. My friends insist I would get a far off, dreamy look in my eyes while doing so. I'm not sure I believe that, but it might be true? ? ? :-) It never occurred to me to build one until you introduced me to the idea of the Bruce Kelley party and these things still being used on the air! I realized from the outset that most period rigs didn't look like the ones in magazine articles of the day. Nevertheless that look was the look I wanted to capture. It just calls to me!

Originally I had planned to build only a simple oscillator transmitter. Having doubts about finding the parts to make a Hull Hartley look as I would have wanted, I settled on the TNT. Then I discovered the receiver which had appeared in QST the previous month, and thought I should like to build that too. Then the real trouble started! In the course of my research I had fallen in love with some of the early rigs employing more than one stage. Those majestic tubes, dials, and meters lined up was too much to resist. It didn't take long for an image to form in my head. MOPA, meet BUG. I could clearly see a two or three stage '29 rig with type A velvet verniers and Jewell 54 meters on each stage sitting atop my operating table or displayed in the living room! (I'm single, I can get away with stuff :) I was off to the races!

Rational thought has now managed to re-establish a foothold. Perhaps one day I can revisit the idea of the "big '29 rig." :-)

9087. Want to Buy: Two Miller 1730 IF Transformers

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-01-06 20:18:55 UTC
From: whitebear1122@...
Topic: 9087 Message: 9087

Greetings and Happy New Year from the Frozen Tundra of Minnesota. Brrrrr..

Want to Buy: two Miller 1730 IF Transformers. I've just completed a major radio sell off that consumed most of my radio time for the past 3 years. I am now ready to get back to my Home Brew Receiver (HBR) receiver project, a 12 or 13 tube superhetrodyne receiver designed by Ted Crosby W6TC back in the 60's and featured in QST.

I want to buy two Miller 1730 IF transformers, they are 1800 Khz so sort of an oddball frequency. If I can't find any then I'll proceed with a set of ARC5 BC-454 1415 Kc IF transformers that I just acquired, but I'd like to take one last look for the 1730's before punching the chassis. Can you please check your junk box for me?

I'm also looking to buy a BUD style cabinet that handles a 19" rack panel, is maybe 10" tall, has a lid. The style I've seen has rounded vertical edges on the front, and a lid.

Thanks. Best Regards, Scott WA9WFA in Saint Paul MN

Lou suggested I share this picture of the TNT in its usual position... on display in the living room. Every visitor, both ham and non-ham asks about it sooner or later. :-)

The key is displayed to the left, not visible in the photo. Eventually I hope to have the little antenna coupler / RF ammeter displayed similarly -- but not until I can get a dust cover made for it. I cleaned those parts once... :-)

Hi Paul,

Looks absolutely SUPER...

Yes, I can well imagine how a visiting "...audiofool" might react at the sight of that rig---probably think it's some sort of a super wide-frequency audio amplifier, & will immediately offer you $1K for it on the spot! Hi Hi

Nice job.

I usually don't like tooting my horn but someone asked about the TX. It was originally described in the March/April/May QST of 1934. I have adapted the orignal design somewhat. The original line-up was 59 Osc, 841 Buf/Dblr, 830 PA. The unit shown uses an 89 Osc, 802 Buf/Dblr, 830B PA. I found the 841 tough to deal with. I can run either an ECO or use the 89 as an Xtal Osc. All power supplies are solid state with double-L filtering. No Mercury tubes here! About 60 percent of the parts are period correct. The bread-boards are pine shelving to which I added Aluminum ground planes.

I strive to put the best possible signal on the air. In that respect, I use regulated voltages where needed, a homebrew differential keyer (not period correct) and relay based QSK set up.

Future considerations include an 860 PA stage. It is definitely a work-in-progress.

One can see a portion of my Bliley Xtal holder collection on a board to the left of the TX base.

I submitted an in-depth article on the TX to Electric Radio but as yet it has not published.

Thanks for the interest.

GA all,
I can't remember from last year...does a QSO with a non-member,
non-participanting station, who just stops by and using a rice box, count?

I also question the 160m freqs...1835-1855kc...is that correct?
If so, would there be a dis-qualification to operate around 1810?
My Meissner works much better below abt 1820kc.

Are you guys gonna be on 160m any particular times?

Tnx...73 de Bill K4JYS

Bill...although I have not entered the LC Party, I'm sure that you can work wherever you chose on 160m for the affair....no one is going to bother spot checking frequencies. Personally, like yourself, I'd feel more at home right at the bottom end where most low power / casual ragchew QSO's take place. Up until not too many years ago, the low end was like all of the other CW bands, strictly for serious DX work but all seems to have changed now as the longhaul seems centered much higher in the band now ...1815-1830 for the most part.

GE gentlemen,
     As I understand the paragraph labeled OBJECTIVE, it would seem that Non-AWA QSOs would count as long as equivalent info was passed. My interpretation may be incorrect though.

     The text reads "or other participating stations preferably using pre-1950 gear and low power."

Hey Steve,
I too, feel better hanging around in the 1.8 to 1.815 area, esp with a not-to-todays standard xmtr...hi. Not sure just why the upper freqs were chosen...probably goes way back and maybe there are some ops with xtals for that section. I think there is some digital in that area too. Anyway, I will probably be on for a bit around 1810...if my line noise doesn't rear its ugly head.

I didn't see the original question so I may be off topic. The 1835-1855 segment seems odd, as that is used by digital and SSB. I personally get very nervous operating the parties or making general CW QSOs above 1810. Perhaps it's because I've been chasing DX on 160 for many years and have seen how easily a domestic QSO can inadvertently wreak havoc on someone's attempt at getting a choice bit of DX. With so many parts of the world having limited windows, sometimes only a few kHz somewhere in the 1810 to 1840 range, I just don't feel comfortable making domestic QSOs there. DX signals are often very weak, easily QRMed, and undetectable by the average station not employing directional low noise receiving antennas. The 1810 to 1815 segment has become a popular hang out for some of the very rare, very weak DX to call CQ. The basic problem is not enough space for different interests and the varying international allocations. There is no solution for that. Everyone should operate according to his own convictions and comfort level, of course. Have fun!

I think it was only in the past few years that the BK rules were looked at and revisions presented. Perhaps these are still the same rules from the original LC Party and nothing has been changed (except 160m band plans!)

I only spent about a half an hour on it last night, all rockbound on 1810 KHz with 2 watts RF out from a 59 (tube type, not year) xtal osc. rig. I got a 579 from Jerry W1ZB, and a bit later heard K4JYS calling "AWA" close to my frequency, weak but readable. I gave Bill several calls but he wasn't hearing me.

Haven't tried 80M or 40M yet - will probably wait until the weekend as other tasks demand my attention. My aim is to make a few QSOs and give a few points, not to compete.

Hi Larry,
Sorry I didn't hear you. We had a fair amt of QRN...not all the time, but pretty strong peaks when it was there. Yes, I was lucky that Jerry, 1ZB heard me and we worked. I also worked Ron, N4GJV, here in NC for a good QSO on 1810.
I was running the 1924 four coil Meissner w/4w input into the inv L...HQ-120 rx.
On 80, I worked Jim, W8KGI in NM ...boy that was a treat. I was running the T-19/ARC-5 on a 100ft wire on 80m & BC-652A rx. Also worked John, N2BE in NJ.

I will probably be back on some this w/e, but, like you, just wanting to make a few QSOs and having some relaxing fun.

I'm not sure how others are faring but for myself, it has been slim pickings. I stuck pretty much to 80. Thus far I have 2 Qs in the log. One of these was outside the LC window. The noise level has been high at this QTH and averages S4. I hope to hear a few more of our illustrious group later today and Saturday.

I'm going to try 40 again a little later. Hope we can make the grade. I'll try around 1530R.

I managed to work N2BE and W1ZB through the racket.

I might add an outboard noise limiter to the RME-69 at some point.

Roger.

Hello Roger, Bill, et all,

I intend to look for you guys at ~ 1530R/2030Z, on 40m. I will be using my QRP Hartley, so please listen carefully, for my puny signal! I also intend to be QRV on 80m (again with QRP), at ~ 2200Z-2300Z.

I was only QRV briefly, last eve. My main goal was to log my first recent history QSOs on 160, while using the dipole & 227 Hartley xmtr that I hastily constructed between the 2 weekends, of the BK QSO party. (I logged no 160m QSOs during the BK event, due to a feedline problem, that was not discovered until too late).
I was using my 24A/27/27 regen rx, and it was quite a thrill to work K4JYS and W1ZB, on 160. W1ZB mentioned that he was also using a regen rx, during our QSO.
I heard no other AWA stations, on 160m, during the ~ 1 hr., that I was QRV.
There was some QRN, but it was not a serious problem. That was a huge improvement over the QRN problem that existed during the 2nd weekend of the BK QSO party!

These QSOs were logged on ~ 1810 Khz. As Paul, N1BUG, previously stated, the suggested 1835-1855 Khz portion of the band was filled with SSB signals.
I hope that participants will be looking down around 1805-1810 khz, on Saturday. W1AW's signal was very strong on 1802.5 Khz. My simple regen rx does not have adequate selectivity to allow me to effectively hear well, near the freq of either W1AW, or the strong SSB signals, that were higher in the band!

73 & GL de Ron n4gjv

Between 80 and 40 I managed nine contacts using my TZ-20 transmitter <http://w0vlz.blogspot.com/search/label/TZ-20%20RF%20Amp> and HRO Sr with a low hung inverted L antenna. By contesting standards not a lot but this still ties my LC QSO counts going back 20 years. I was surprised to not hear many of my MN friends on the air. Of the eight I worked in the BK I only heard one on for the LC....maybe Saturday/Sunday.

I have grown to depend on the Reverse Beacon Network to help me decide if the band is dead. If I call CQ and I don't get a lot of feedback from the RBN with reasonable signal strength it's time to change bands or go to bed.

Hello,

This early '30s HB receiver was acquired by a friend in Italy. He wants to know what type of circuit it may have. That is, type of regeneration control, short or medium wave and on...

Claudio is a high school level physics teacher in Rome. When covering radio he uses early tubes and parts to demonstrate wireless theory. His students come alive at this approach. If anyone wishes to answer his questions on this receiver his e-address is: clan.idee@... It may take awhile for Claudio to respond do to his having to translate his reply to English.

Looks like it could be a war time clandestine transmitter/receiver built from scavenged parts. Very low power because of the tube used. In the photo with the parts laid out, the furthest part to the right may very well be a crystal. So, possibly a low power transmitter and regenerative receiver set.

It appears to be a classic "Doerle" style 2-tube regenerative receiver. One of the variable capacitors is for tuning and the other is the regen "throttle" cap. The A409 tube is a four-volt filament at 65mA. Tuning: Best guess assuming a coil diameter of 2" and a 100pF tuning cap is 4.5 to 10 MHz. The only thing that "bugs" me is "Where is the feedback winding?' The banana jack and the miniature phone jack is either a recent addition or the receiver is newer than assumed. The thing that looks like a crystal looks, on closer inspection, to be a trimmer variable capacitor.

My plan is to start out on 40M Saturday evening, move up to 80M when 40M becomes non productive, and then move up to 160M when 80M slows down. Larry

A good plan, Larry. With the late comments about 160 operation wondering if a consensuses has been reach as to where to look for AWAers? The official 1.835-55 or 1.800 -10?

Having the coils for the three bands will use the TNT/UX210. I see on reading Mr. Murphy's rules and regulations the scoring examples include both the transmitter circuit and tube used. Excellent idea! which I have adopted. This approach is even more fitting for the Kelley Party.

Wednesday I worked three stations all on 80 using the TNT with rectified, unfiltered B+ (T-3) at 3W input. The powre transformer's high voltage starts out at 350, but when keyed drops to about 150V hence the 3 watts.

N9HAL (a rare one) RST given, 588 Rcved, 446 "Ur sig vry vintage."

W1ZB (another) 559 / 557

N2BE (a new one) 589 / 594 "Can't believe ur running only 3W. Snds like old time electric razor."

Hope to work you Niel, Roger, Larry and on. Did I read that N1BUG was on Wed.? OIL would be a feather and 7SL if he'd only get on.

9144. LC 1950 Question

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-01-18 18:24:13 UTC
From: JAMES HANLON
Topic: 9144 Message: 9144

Y'all,

My question is whether a piece of gear made in 1950 counts as "vintage" or "modern" for the Linc Cundall contest. The Announcement says in several places that it is for "pre-1950 gear," and for "equipment constructed before 1950." But in the Scoring Details section, it says, "Send 'MOD' for modern (after 1950) gear."

I have several transmitters that first came out in 1950, including a Lettine 240, a Harvey Wells Bandmaster TBS-50C/D, and a Lysco 600. I also have an SP-600 receiver that came out in 1950. Are these guys MOD or are they vintage?

By the way, I hope to be burning a hole in 40 later this afternoon with my 275 watt Globe King 275 from 1947. Look for me there, please.

Thanks,

Jim Hanlon, W8KGI

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-01-18 21:38:05 UTC
From: Louis Vermond
Topic: 9148 Message: 9148

I'll be on 1810 or 1803 (more likely the former) OK will look for you there. Again following your band working pattern.

On 80M and 40M there's no telling where I'll be (really! ;-)) as I'll be running the '29 rigs. We'll maker yet...

73, Lou

9156. LC Test - Lots of noise

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-01-20 14:57:07 UTC
From: Roger Kuchera
Topic: 9156 Message: 9156

Gentlemen,

After the LC test, I tried 40 later in the evening but much to my surprise I had a S7 noise level here at my QTH. Just to make sure the RME-69 hadn't developed a problem, I gave a listen on my ICOM-7700. The band scope showed a picket fence all through 40 meters. There was an apparent broad peak around 7.100 Mcs. I folded my tent and went in to watch the "one-eye." As the old saying goes "He who fights and runs away, lives to fight another day."

My Thanks to those I was lucky enough to work.

CUL, Roger/K1TG

Hi Larry,
     Yes, indeed it was good to QSO. Imagine my surprise when I worked N1WPU (ME) on the next QSO.

     I did a little 80 on Wednesday but the bulk of my Qs were on 40. I have never been on 160. I don't have the real estate to put up even a mediocre sky wire, so I have never bothered.

     I plan to get involved with the Rollins affair in March. I hope to add some improvements by then.

     Take care and stay warm.

CUL, Roger/K1TG

picket fence all through 40 meters. There was an apparent broad peak around 7.100 Mcs.

Similar conditions here Roger. Loud digi-crud between 7.100 and 7.110, a couple SW BC carriers a little further up, and then sidebanders on 7.120-7.125 made the LC window tough work.

Mike,

I am attaching a spreadsheet with my 2014 Linc Cundall Contest log. Let me know if you can read it OK. I Included several additional fields for my transmitter, power, and receiver information, since I amused myself during the contest by switching gear. For transmitters, I wound up using a BC459, Millen 90800, CBY 52209 (Navy BC457), Globe King 275, and Viking 1. For receivers I used an HRO-50, NC-173, BC455, SX28, NC101X, HRO-5, HRO, HQ-129X, SX-28A, and HQ-120. All of these guys are 1949 vintage or earlier. Now that I have learned that 1950 vintage gear also counts, I will expand my usage of gear in the next Contest.

I had fun, and I made 20 contacts from out here in New Mexico. I attribute at least some of my success to saying to heck with the power multiplier and putting that 275 watt Globe King on 40 where it was apparently heard near and far.

73,

Jim, W8KGI

Last year my friend Rod, G3NDI received a card from his wife, I've forgotten the occasion. Knowing of my interests, Rod scanned the card and sent it along to me.

After I forwarded it on the some of you there was a flurry of guess work as to what it was all about. All suggestions, it turned out, were wrong.

The other day I was looking through past OTBs and came across what you see below. Considering, the fine cut of his suit is no surprise.

It doesn't look transmitter-oriented. I wonder if it was one of the many radio-related snake-oil products produced in the 20's...maybe was guaranteed to 'neutralize' the noise on your antenna or something odd.

It doesn't look transmitter-oriented

This will be one of those Of course! moments. Was for me....

The TRF receivers such as the Neutrodyne (I have one by the way) had two RF amp stages and a AF stage. Both RF amps had these adjustable caps from the plate back to the grid for neutralizing the triodes. KK7UV

Here’s a decent writeup: http://www.sparkbench.com/trf.html

9188. Suggestion for changes in the LC Contest

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-01-28 01:30:16 UTC
From: JAMES HANLON
Topic: 9188 Message: 9188

I'd like to start a conversation with this group about some changes in the Linc Cundall Contest.

As I understand it, the main objective of the contest is to encourage folks to restore and operate transmitters and receivers from 1950 and earlier. It also should be fun for anyone who cares to take part.

In order for folks to enjoy participating, they need to be able to find a good number of other stations on the air and operating the contest. This would be best served by encouraging all contestants to put the strongest signal on the air that their equipment is capable of. While low power is usually sufficient for a participant to work stations up to several hundred miles away, it generally doesn't give the kind of consistent, nation-wide coverage that we really ought to strive for, especially on behalf of participants who live outside of the areas where there are a cluster of stations, such as the North East and Minnesota.

Also, because the current rules limit participants to only one contact with another participant on a given band, it is common especially later in the contest to hear two or three folks calling "AWA" on the band but not being able to talk to one another because of a previous QSO. That's silly!

I have several suggestions that I think would improve the contest that I'd appreciate you considering and commenting upon.

First, eliminate the "power multiplier" in the scoring of the contest. The power multiplier encourages a participant to put on a weak signal and makes it harder, particularly for others far away, to hear him. It would be better to encourage the participant to put on the strongest signal that his transmitter is capable of so that more stations could copy him.

Second, allow a participant to make additional QSOs with other participants if he changes his transmitter/receiver pair to another pair that still meets the requirements of the contest. That would encourage folks to acquire, restore and operate more than one transmitter and receiver, and it would increase the general activity level of the contest.

Third, open the contest to 20 meters. There is plenty of gear from the 1950 and earlier era that works well on 20 CW. Lower power rigs work out further on 20. And giving participants yet another band would allow them to make more contacts with the same number of opposite stations by the current rules of one contact per band.

Please let me know what you think of these suggestions. And feel free to make more suggestions that you think would improve the LC Contest.

Thanks,

Jim Hanlon, W8KGI

Lou,

The TRF radios of the 20s needed to be neutralized. All they had were triodes for the RF stage. The Brown-Drake receiver (the first user of National Radio parts) specified a Rathbun 3 plate condenser for "balancing". See http://www.prismnet.com/~nielw/browning_drake/BD_Rcvr.htm See also Wikipedia's description of the neutrodyne at http://en.wikipedia.org/wiki/Neutrodyne

Thank you, Niel. My question was motivated by eBay business. I have a 1920/30s English neutralizing condenser I want to offer, but had little understanding of its intended use. I do now!

I have two of these, the keeper in the original box. The design and quality are wonderful. 73, Lou

http://www.isquare.com/millen/bio_rem/alegero48-55.html This "reads" like Hammond Mfg. while I was there in the '70s. So much life than.

All this for that little job.

From: Larry Szendrei
Topic: 9188 Message: 9192

Hi Jim,

My thoughts:

I agree that the power multiplier should either be changed to encourage higher-power operation, or eliminated so as not to discourage it.

I'm agnostic on the multiple-station per band suggestion. I probably wouldn't bother putting more than one station on any single band - just out of laziness, mostly, because I certainly have enough stations! OTOH, I suppose those that would should be rewarded. In your suggestion, if station A changes equipment and then works a station B that station A had already QSO'd on that band, would both get credit for the 2nd contact, or just the station that had switched equipment? And how would station B know that station A had changed equipment, so that he could know he could work him again?

I also think it would be good to add 20M to the mix. Of course, the John Rollins DX contest in the spring does that.

Also thanks for the Herculean effort you put in to complete our LC QSO on 40M. You had a good signal into Maine, but I was only running a few watts out (12W DC in, lousy efficiency!) from two 71A's in a push-pull TNT.

73,
-Larry/NE1S

From: Niel - W0VLZ
Topic: 9188 Message: 9193

Jim,

I also believe the LC rules could use a little tuning since the qualifying date has moved to 1950.

1) Power multiplier. For a contest like ARRL Field Day with lots of QRM/activity it really does take transmit skill to make contacts using low power. In the case of the LC, though, with relatively average band activity most of the skill/effort rests with the receiving station to pull the QRP station out of the noise. If any power multiplier, give it to the receiving station, not the transmitting station.

2) Xmtr/Rcvr pairs: This sounds like a good idea but I'm a little concerned that we don't turn the LC into another version of the Classic Exchange. See http://www.arrl.org/news/classic-exchange-a-vintage-radio-contest . One solution is to limit the number of non-AWA points to, maybe, 10% of the total.

3) 20 mtrs. Several years ago when the "LC" was the AWA OT CW Contest it did include 20 and, in fact, I suspect even today 20 mtr contacts are countable just like any other contact outside of the published contest frequency window. 20 mtrs would certainly help west coast involvement and is easily within the capability of typical 1945-1950 equipment. I vote for adding a 20 mtr frequency window back into the published rules.

73,
Niel - W0VLZ

Well guys - let's see if I can sort this out...

Eddy; Nice try but does "Fat chance" translate into Canadian? 8^)

Lou: There is a local radio surplus store in the Portland area (Oregon, not Maine!) that has goodies like that show up from time to time. Couple that with my knack of being in the right place at the right time and there you have it. I showed up just after Bob Lee (the proprietor) received a huge estate sale. No cool tubes though.

I am contemplating the Hendricks receiver along with a couple other prospects. Or I could sell it and buy a condo on Maui!

Dan, may I ask you what you paid for it...? It's a really neat, early-vintage National vernier that's very rarely seen in that type of condition, bar none. I recall that latter-day Eddystone slide rule dials---N.I.B.---commanded prices in excess of $100.00 on eBay...and those rascals were from the 60's!

This was a half-started project over 2 years ago, then put on the shelf until this past December. I have it currently set up with an 841 tube, but a simple grid resistor change and it will run the '10.

Pics are also in the Pictures folder under KK7UV.

Topic: 9215 Message: 9217

A few weeks ago I discovered a new Joe Veras book, A History of QST: Advertising, listed on the ARRL site at http://www.arrl.org/shop/A-History-of-QST-Volume-2-Advertising/ It is over 350 pages of QST ads from 1915 to present with a little introduction for each decade. Each ad also has two or three lines of additional explanation to help understand how the product or company fits into our history. As stated on the back cover "It is an intriguing journey of Amateur Radio's rich and varied history - told through the creative marketing, advertising and photography of yesteryear."

Great reading and good information.

Hi Lou,

It may interest you to know that just exactly that same roller inductor is used the final pi-tank system of my 2x813 kilowatt linear amplifier, as well as in my Universal SPC transmatch...

The latter cost me $8.50---N.I.B. surplus---from the old "North American Electronics" in Montreal, back in the mid-70's. It was WW2 excess stock, & arrived at my door still boxed in its WW2 "...made-for-all-seasons" packaging: wood, wrapped in tar paper, wrapped in paraffin wax-soaked burlap. Amazing. It took me a half hour just to "un-crate" the thing!

Hi Lou,

Well, not especially: STILL in constant knee pain here, & this darn winter has MORE than over-stayed its welcome this year.

I usually don't pine for summer wx until about 1/2 way though February---but these continually cold temperatures & near daily dumpings of fresh snow are REALLY getting the better of me!

Hi Steve,

It's certainly been an inordinately L-O-N-G and destructive winter this year, for sure...

"Victims" of the ice / cold / winds at this QTH...?

---My two K9AY loops (a tree collapsed right atop them);

---My 1/2-wave 160-meter dipole (it snapped when a tree fell atop the northern half---the southern half broke due to wind);

---My north "L" in my 160-meter 3-element phased array (the tree supporting the end snapped in half), and,

---My east "L" in the same array (the tree supporting its end came down).

All-in-all, a LESS than "stellar" typical fun-filled & frolicking winter of low band DX'ing, as I'm sure you'll agree...

...And the clean-up of the place has YET to come, too (sigh!).

Hi Steve,

Well, if there's anything GOOD inside of the apparent BAD that hits us, maybe this was all part of some "master plan" for me to try something different for 160-meters here...

I'd had the loops & the phased array for some 7(?) years here---and I think I pretty much milked them for all they were worth. Maybe it's time for an array of short receiving verticals on 160, and a RAISED radial system...? I don't just now---yet. But as is the case in everything else in life, things really & truly DO happen for a reason(s).

I've got one similar to that in the "big rig," but it's the roller that
moves around the inside of the coil; the coil itself doesn't rotate.

While this hardly qualifies as a radio subject, there were a number of "Mountie" related radio and movie serials. There were 8 movies with Renfrew in the title. There are 2 dogs mentioned:

    Lightning, The Wonder Dog
    Chinook, The Wonder Dog

My memory of the other popular Mountie, Sgt. Preston, was partially correct. His dog was Yukon King.

Rin Tin Tin was actually rescued at Lorraine, France during WW1 by an American doughboy. He died in 1932 but his heirs seem to go on forever. I could find no particular personality that was attached to his name.

9246. RE: Suggestion for changes in the LC Contest

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-02-06 03:29:30 UTC
From: JAMES HANLON
Topic: 9188 Message: 9246

First off I want to thank Neil, W0VLZ, and Larry, NE1S, for your replies to my original posting. I also want to apologize for not getting back more promptly. I was denied access to my email for a week (Thanks Microsoft!) and just got it back yesterday.

Neil, you commented that we shouldn't turn the LC into another version of the Classic Exchange. I should acknowledge up front that I have operated the Classic Exchange consistently from nearly when it started, and I even was the guy who was in charge of it for a while. So I do come from that background. One of the things that I like about the CX is the level of activity. On the last running of the CW CX, January 26 , 2014, In about 5 hours on the air, I made 77 contacts. In the last LC Contest I also spent 5 hours on the air and made 21 contacts. I do have to say that I had more fun operating the CX because of the much higher contact rate. And that's why I'm looking for ways to increase the number of contacts we make on the LC.

As to the Power Multiplier, and to the possibility of giving it to the receiving station instead of the transmitting station as Neil suggested ... I'm reminded of an experience that we had with the CX scoring formula. Originally the formula involved a multiplier for the total number of different receivers and transmitters used by the stations that we contacted on each band. The idea behind it was that contestants would be motivated to contact stations using different, nearly unique gear and that in turn would motivate guys to get that sort of gear on the air. It may have been a good idea, but it sure made the scoring complicated. When John MacAulay, WQ8U, took over running the CX, he eliminated this multiplier from the scoring formula. It didn't dampen anyone's interest in the contest, and it made the scoring a lot easier and it eliminated a lot of scoring errors. So ... the moral of the story is to Keep The Scoring Formula Simple. That would suggest that we don't need to give any extra points to the receiving station for digging out a weaker signal.

Larry brought up a couple of questions about the suggestion of using multiple Transmitter/Receiver pairs.

"If station A changes equipment and then works a station B that station A had already QSO'd on that band, would both get credit for the 2nd contact, or just the station that had switched equipment?" Again, to keep it simple, I would say that both station A and station B should get credit for the second contact.

"And how would station B know that station A had changed equipment, so that he could know he could work him again?" In answer to this one, I'd say that station B would just have to copy station A's transmission to see if he had changed equipment or not. If he had changed, it would count as a second contact. If he had not, it would just be a duplicate contact and station B could remind station A that they had already made a contact on that band with that equipment. It's really no different than what we do now. Neil and Bob, AA9DH, both called me on 40 on 1/18, and we had previously worked on 40 on 1/15. So I just said thanks and 73 & GL and went on looking for another QSO. No biggie. One thing though, rather than giving the date of the equipment we are using, as in "RX 42, TX42," it would be better if we would switch to giving the type of equipment we are using, as in RX BC455, TX BC459." That way, if we made a later contact with a "RX BC348, TX TCS" report, there would be no

question in Station B's mind about whether we had switched equipment. We would have to think about whether to allow an additional contact if only one piece of equipment was changed - probably not if we want to avoid becoming too much like the CX - and whether to allow an additional contact if another pair in the MOD category was used. For example, if one of the stations switched from using a DX-100 and a NC303, both MOD, to a Valiant and a 75A4, also both MOD, would we want to count that as an additional contact. My feeling on that one, since we are trying to encourage folks to restore and use VINTAGE equipment as opposed to MOD equipment, would be that we should not count that as an additional contact. But I'd like to hear others opinions on these questions. That brings another thought to mind. The CX does not have a strict cutoff date for equipment that can be used as we do in the LC Contest. Rather, the CX encourages folks to use older equipment by having an "age multiplier" consisting of the sum total of the age of all receivers and transmitters used for three or more QSOs in the contest. We do something of that sort by having a scoring multiplier of 3 if we use a receiver and a transmitter that are both Vintage, a multiplier of 2 if only one of the pair is Vintage, and a multiplier of 1 if both are MODern. In that regard, our "cutoff date" is not an absolute since we do allow the use of MODern equipment in the contest. Would we want to consider something other than the Vintage and MODern classifications that we are using right now? Again, I'd appreciate it very much if more folks, especially those who operate the Linc Cundall Contest, would join in this conversation. 73, Jim Hanlon, W8KGI

I have those but I always mount them from the back. The knob has to come off first and then the 3 dial mounting screws. Once those are off, the mounting may become a little more obvious. If I remember correctly, it requires a fairly large hole in the panel. The tabs on the half round disk on the back are for stationary stop screws. It's slightly complicated figuring out how to orient the mounting screws to get the turning range you want.

Leonard

Robert,
Your dial was most likely removed from the tuning unit of a WWII vintage BC-375 transmitter. The same velvet vernier drive mechanism is used in the National Type ACN and MCN dials that were designed for amateur radio use. I used one of these dials in one of my homebrew regens, but I removed the heavy ceramic and the sheet metal parts of the coupling, and made my own coupling out of a round piece of phenolic printed circuit board material and the part of the original coupling that has the set screw for attachment to your tuning capacitor. The ceramic part is not needed as your regen will probably have no very high voltages, and the sheet metal part just restricts the rotation to 90 degrees and makes the mounting orientation more difficult, as Leonard Meek has suggested.

The dial drive mounts from the back, not the front, and as Leonard has said, you will need to remove the knob and the dial. You also probably need to remove the coupling from the rear in order to have access to the four mounting screws. Then you will be able to see the size of the holes that you will need to drill in your front panel to mount the drive mechanism from the rear. The instructions you have, that say mounting from the front are probably for a different National dial, but may have the same mounting hole pattern.

I have attached photos of a BC-375 tuning unit showing your dial in its original use, rear views of the National ACN and MCN drive mechanisms with and without the capacitor coupling attached, and front and rear views of my regen using this same dial with my modified coupling. I don't know if these attachments will get through to the group, but you should get them. Good luck with your project.
Mike, W6MAB

Hi Robert,
     That particular variety of Velvet Vernier is mounted from the rear of the panel. Remove the dial and it's attendant skirt, the ceramic coupler and the extra piece of sheet metal. It may be bolted or spot welded to the back of the mechanism. You will need to drill a large hole in the center to pass the hub of the vernier and 4 mounting holes. The mounting screws are somewhat smaller than the standard binder machine screw. The standard doesn't sit flush on the vernier. I have resorted to spinning a standard screw in my drill press and filling the edge until it fits. It's a bit extreme but it works. Also, the vernier will turn 360 degrees. I have one mounted on the shaft of a Heath VF-1 VFO and it does a dandy job of slowing down the tuning rate. Good Luck with your project.

Interesting that there were no comments on this item. Maybe some of you do not recognize it. It is a Marconi Magnetic detector, that was relatively common from about 1902 to 1912. It was deemed vastly superior to the coherer, and, had greater sensitivity and did not need to be de-cohered, so, it could be used at higher code speeds. Due to its ruggedness, it was often used on ships, including the Titanic. The clockwork motor had to be re-wound about every two hours. I also have an Italian one that is electric motor driven, and, I am attaching a photo of that as well. 73 - Mike

Made contacts on 160M, 40M, and (mostly) 75M. Tried for a while, but couldn't stir up any activity on 20M. Have not sifted through my notes to get a total yet.

Thank you, Larry. I had big hopes, but the contest passed my by. :0(73, Lou

Very nice job. You have inspired me to go back and try again as I had no luck in getting modulation. The mic works fine according to the scope so I am going to follow your example.

Hi Carl,

From resent experience here and at VE3LYX, the amount of microphone resistance has a baring on results. Results meaning, of courses, DX and voice fidelity.
The mic. Don sent was to get me started which it has, but it's resistance is too low (166 ohms) needing, it appears, to be in the 400 ohm range.

I have little information on the ways and how-tos of loop modulation. If anyone cares to wade in on this topic it would be helpful.

73, Lou

I concur.

Tks Larry, made of bench scraps.

Now, please hold forth on carbon microphone requirements for loop modulation. Going to begin looking for a mic and would be helpful to not go into it blind.

What's your understanding of the AM contest participant numbers?

73, Lou

Not an expert on loop modulation, Lou, and my reference books of the period don't go into much technical detail.

That said, from basic principles you are transferring a considerable fraction of the RF power from the transmitter into the microphone - it is, essentially a variable resistance dummy load. Maximum power is dissapated in the microphone element on negative modulation peaks, and a minimal amout (ideally none) on positive peaks.

So it is essentially a matter of impedance matching and appropriate loading. So it should not matter if the carbon microphone has a resistance of 50 ohms or 600 ohms, as long as it is appropriately matched. Lower resistance elements will require fewer turns on the loop, higher resistance elements will need more turns. The loading (coupling of the loop to the transmitter) should be adjusted such that the RF power to the antenna is about 25% of the full output when the loop is not coupled to the transmitter. Again, this is from basic principles; nothing I have read specific to loop modulation goes into this level of detail. The microphone element needs to be able to safely absorb the power, so we're mostly talking QRP here. I guess you would want as large/massive an element as you can find.

Gentlemen,

At some point I exchanged emails with an AWA member re: the RME-69 xtal filter circuit.

I have since lost track of the gentleman due to PC failure here. Specifically, we discussed the inability to get the filter to work or work well in "Series" mode. This is a sort of APB asking if the person would step forward to renew the contact.

Hi Roger,
Unfortunately I don't have a picture of one the original is still in the WS19mk3 it's going to be a very big task getting at it, so I left it as is, I would like to have a replacement before I go in and perform surgery on the WS19Mk3. A generic trimmer cap of 3-40 Pf @ 500v is fine because it's inside

Steve -

I do recognize them. They were used mainly with the BC-474A transmitter/receiver unit. The 474A is a neat little set made by RCA, initially used in aviation as the AVR/AVT series, and then put into service for the military early in WWII. 73 - Mike

Steve -

I could not remember, so, I looked up the schematic, which is below. According to the schematic and the verbiage in the manual, it appears it would be a carbon. Although, from the schematic it looks like a dynamic may work as well in the circuit, which of course is no consequence to you. 73 - Mike

From: Steve Flood
Topic: 9287 Message: 9296

It was easy to open one up and check the element - it is carbon. The granules are loose and not stuck together which I think is desirable. However, the element measures many megohms resistance.

9297. AWA 1929 QSO Party List of Received Logs, both Mail and Email

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-02-26 14:47:53 UTC
From: whitebear1122@...
Topic: 9297 Message: 9297

Gang, Here is the preliminary list of 1929 QSO Party logs that I received via mail and email. This is the first draft. I need to go through the pile of logs tonight and double check to make sure they all got to the list, and the recheck the numbers . If you sent in your log and don't see it here, please let me know. If you didn't send in your log, you still can and I encourage you to. I will getting this off to Tim W1GIG this coming weekend so stragglers have one last chance :)

I always start this years list from last years list, adding and deleting as necessary. I noticed maybe 10-15 log submissions less this year. Like usual I will go through each log and extract all the call signs of stations operating in the event so we can see who all partipated but didn't send in a log.

From going through the logs, it looks like everyone struggled with poor propagation and static. Many scores are down by maybe 10 to 15 contacts. Lots of comments about propagation, not hearing as many, and static. I know at my QTH 40 meters was nearly worthless both weekends and I was counting on 40m big time. 80 meters didn't seem to go long much. I heard only a fraction of the New England states as I normally do.

There are several guys who always impress me with their 29 operation because t hey use homebrew regen receivers for part of the event. Wow!

Did you know California was on the air for one contact. WA6VYN. Howie WB2AWQ/7 was the lucky QSO with California. Lets try to encourage WA6VYN to give out more QSOs next year!

Thanks. 73, Scott WA9WFA

I never heard of "drilled through" unless it was a used dial "modified" by a previous owner.

I found the exact size and length studs needed for the Type B dial in a hobby shop catering to radio controlled airplane builders. The studs come in a little plastic packet of three as found along with other plastic packets of nuts, bolts, screws, etc as used in R/C airplanes.

Got them too long ago to remember the store, mfg. name, etc.

Topic: 9313 Message: 9313

I'm looking for the cabinet and covers for a Command Set transmitter, because it is the right size and shape for a planned project.

I don't need any of the internal parts, and as long as the chassis aprons and covers are in reasonable shape without any extra large ugly holes it will serve my purpose. Large ugly extra holes on the front of the XMTR or top of chassis are OK because I will be fabricating new plates that will cover these surfaces. Either the ARC-5 or BC- series of transmitters are OK. The Command Set receivers are too small for this project.

Someone out there must have a well-hacked, beyond-restoration unit in their junque box.

Will trade for parts or tubes of approximate equal value (preferred - I have a well-stocked junquebox), or am willing to pay $10 plus postage for a unit meeting the above description.

Please reply directly (not through the lists).

I'm sure it's been suggested before but.....

I was wondering about a daily/weekly sked for the AWA group so that we wouldn't have to wait for the few contests to put these fabulous rigs on the air. Perhaps between 7.100 and 7.110 as in the BK.

9322. de K1TG - RME-69 Xtal filter

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-03-19 13:11:55 UTC
From: Roger Kuchera
Topic: 9322 Message: 9322
Attachments: 1 described; binary payloads are missing from this source WARC

Gentlemen,

I own an RME-69 (#988) made during 1936. I recovered the final test tag from the bottom of my RX, so I know the exact date of manufacture and test. I've done a partial restoration of it. I became concerned with working of the Xtal filter in my unit. Apparently, RME made a change to the circuit in early 1938. Trying to run down exactly what it was has proved to be elusive. The Series mode doesn't seem to work very well.

Using some rather seedy copies of the RME-69 schematic, I think I've deduced what the change of 2/1/38 to the Xtal Filter entailed. They didn't use the Off-Series-Parallel modes in the early models just On-Off. A mechanical stop on the Phasing control shorted the xtal out in the Off mode. Not only did they change the circuit but they changed the crystal itself. Earlier models used a Bliley BC3 type holder, a horizontal type with a small machine screw in the top. This was referred to as a "shipping" screw, to be loosened by the new owner. The later models used a Bliley CF-1 type holder, a vertical type with ceramic holder. Both are marked with the nominal IF frequency of 465 Kcs.

I have attached a JPEG of what I think the modified circuit looked like. If anyone has any additional information; Please let me know.

CUL, Roger/K1TG

From: Roger Kuchera
Topic: 9327 Message: 9327

Gentlemen,

My apologies for the previous email dealing with the RME-69 Xtal filter. The wording is incorrect.

Previous to 2/1/38 the circuit used a 3 position rotary switch giving the following: Off-Series-Parallel. After that date they not only changed the xtal but there was only 2 positions: Off-On. The Phasing control was more or less the same.

The latest QST tries to explain the inner workings of a Phasing control.

9328. RE: [AWA Group] filament transformer..good measurements

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-03-20 17:05:59 UTC
From: Poli, Louis (US SSA)
Topic: 9328 Message: 9328
Attachments: 1 described; binary payloads are missing from this source WARC

Lou;
Very good.
Let me recommend this too.

Every time I go to a ham fest, I end up collecting some kind of transformer.
When I get it home, I catalog it for completeness, so I can pull it for some project in the future.
Chances are it was built to run at 110, 115, 117, or 120 VAC.
Now my mains at the house measure at a typical 122 VAC. It fluctuates from 120 to 123, which is very good of course, and also gives me 246 VAC across the legs.
Now this is all good news, unless you wish to operate a tube filament, and are a purist.

Now, what is the bother?
Here is the additional consideration.
When anything is measured as open circuit, without a load on it, the voltage tends to be higher by some amount.

So what is the 6.3 vac filament winding really going to put out under load?
There is not much difference designating between 115 and 117 vac as an input voltage to the transformer when you want to know which input will give you 6.3 vac under true tube load, if you haven't loaded it yet. Most tubes need to light at their designated filament voltage and +/- 5%.

Further confusing the situation, is that the resistance of the filament is lower when it is cold; and comes up to the proper resistance, and self-current limiting, when it is hot several seconds later.
High power transmitter tubes (figure, kind of, 50 watts output and above) are often designated as to be religiously held within their designated margin or risk reduction of life.

This is what I do to nicely catalog a transformer:

1. Connect the transformer to a variac. Any size will do.

2. Measure the secondary's, but the filament secondary's are the most important ones to measure.

3. Measure the secondary windings at 90, 100, 105, 110, 115, 117, 120 122, and 125 VAC from the variac. The low and high ends are to simply show the limits of useful filament voltage and the trends.

4. Now put a load on the secondary. Resistors of 5, 6, or 12 ohms are convenient.

Make them at least a watt.

But the power they can handle isn't too important, if you just measure the loaded output for a few seconds. You can be in and out in less than 2 seconds.

You wish to draw about one amp.

This is equivalent to running about two miniature tubes in parallel.

Do one winding at a time for convenience.

For that matter, place a 5U4, 5Y3, etc. rectifier across the 5 volt winding; any two 6.3 volt miniatures, octals, etc, across the 6.3 v winding; and any 12.6 volt tube across the 12.6 volt winding. Then you can leave it on during your measurements. Don’t worry about the turn on shock for any of this.

5. Now repeat the variac measurements, and you will know everything you typically need to, about the transformer.

Log the sheet of your measurements in a folder, label the transformer with the same number as the log sheet, and you are done.
I have a folder of log sheets, titled as T-xxx, and presently have transformers from T-1 to T-55, on the shelf. I have more to go, as I want to clear the bench table finally.

Now my brother collects Lionel trains, and now that he is retired, he has taken a large section of the basement and is building a huge layout of several hundred square feet in area.
He needs a sub-station that can supply the lighting and miscellaneous power needs of the layout.

This is other than the heavy Lionel transformers that run the number of powerful replicas of Steam, and Diesel Rectifier locomotives.
The AC power mains for supplying those are a separate story.

I live near Allentown.
Several years ago at the packrat ham fest at the 4H grange near Wrightstown in PA; I was looking over an old huge transformer on the ground.

The seller begged me to take it for 8 dollars; otherwise he would have to bring it back home. It is about 70 pounds, and the secondary windings are rated at around 30 vac at 55 amps; and it has taps.
I need about 18 vac for the railroad power grid; and with a large variac, I can set it anywhere for over 1 .6 kilowatts.

I hope the above is helpful to all wishing to use parts like this.

Regards,
Louis N3OL

☐
Lou;
Your transformer is a separate item?
And doesn't belong to any equipment?

Regards, Louis P. N3OL

Hi Louis,

Separate. Thank you, but I went ahead and measured the windings at 117V. All seem appropriate.

73, Lou

9333. Providing 110 volts for older transformers

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-03-21 17:32:54 UTC
From: JAMES HANLON
Topic: 9333 Message: 9333

I've been following the "filament transformer" discussions here, and I have a suggestion for folks who are concerned about putting too much voltage on the filaments of their boatanchor tubes because of the increase in line voltage from 110 volts in the 1930s to 120 or more volts today. My motivation for this is a National NTX-30 transmitter, vintage 1938, which was supplying its six 6L6s with almost 6.9 volts rather than the rated 6.3 volts.

In my collection of filament transformers, I happened to have one with a secondary rated at 10 volts and many amps. I powered the primary from the 120 volt line and connected the secondary in series, opposing with the power line going to the NTX-30. Voila, my input voltage to the NTX became 120 minus 10 or 110 volts and the 6L6 filaments were running at 6.3 volts again.

It was a good use for an idle transformer, I didn't have to dedicate a Variac to the task, and the 6L6s will probably last a bit longer. A triple win!

Grainger, and others, sell "buck-boost" transformers just for this purpose. We used them to run 208V equipment on 230V and 230V equipment on 208V. Works fine, last a long time.

Hi Lou,

There *is* a web page, http://www.w7ekb.com/glowbugs/, (W7EKB used to be list manager), but what I was refering to is the Glowbugs Email list, or reflector, similar to our own AWAGroup@yahoogroups.com. I thought I had seen you join as a member of the Glowbugs list a year or so (perhaps longer) ago? The list topic is pretty much homebrew tube-type ham transmitters and receivers, but sometimes drifts to related (and unrelated) topics. It's a pretty busy list.

Anyway, here's some more info on the Email list:
http://www.af4k.com/glowbugs.htm

Hey all,

I have an X-250 tube I'm trying to identify. The only labeling is an engraved base with the following
- X - 250 -

The X is a bit strange in that it looks like this \/
/\

It's like a large V with an inverted large V below it and a space between them. The dash after the 250 actually looks more like a mathematical division symbol as it has a dot above and below the dash. You can make out the engraved X in the picture below.

Does anyone recognize the manufacturer of this tube?

Next, my TV-2U Tube Tester doesn't have the 250, X250 nor 50 tube in it's charts. Does anyone know the settings for this tube on the TV-2 tester?

Thanks,
Don N9OO

Don;
This should do it.

Evidently the vendor is "Hygrade", of 1929.
They merged with Sylvania in the late 1940's

Try the Sylvania transmitter manuals post 1948.

Ake Holm's tube reference, "TubeData" shows the 250 (and 50) as a triode with a 4 pin base, but the diagram he shows is for a 5 pin full wave rectifier. TubeData is and excelent reference, but I have found some errors in it. I was able to correct the diagrams for acorn tubes but not the text.

Thanks for the data on the X-250 Louis. I wish they had better pictures to verify the engraving was the same. I will search through my magazine archives for the 1929 time frame to see if I can find any Hygrade ads which might have pictures of their tubes so I can verify the engraving style.

I also see that a tube sold on eBay from the Magnatron company. That one had the "Magnatron" name on a sticker, but not on the engraving either. However, from their ad pictures I can't see the engraving well enough.

Thanks again,

Don N9OO

Thanks for the help on the search. I thought I had a setting chart for my TV-2 for the really vintage tubes, but when I checked my manual folder there was no such beast on file. Strange a Google search wasn't much help either. I guess I need to revise my search a little as I recall some really extensive websites out there for all the various military tube testers. I'm sure someone has such a chart. I do know the filament lights on this Globe 50, but I don't recall if I ever checked the gm.

Thanks again

I knew it was out there in internet-land. After several additional
Google searches I found the information.

An Excel spreadsheet that provides to setting data for the "50" tube,
among others not in the TV-2 manual. If anyone needs this here is the URL.

www.antiqueairwaves.com/nlee/files/tv-2_104.xls?

Louis, the only tubes I have that aren't on my roll chart or in the manual are WD-11's and some Western Electric tubes. Since I have no plans to use them for anything, Maybe I shouldn't be testing them. It would have been nice to know there was a setup for testing them though.

Lou,

The 1616 is a high-vacuum half-wave rectifier tube. Do you mean 1619?
(The 1619 is basically a 6L6 with a 2.5V filament/directly heated cathode).

Leonard and Larry,

I was not aware of Franks Data... Very useful. Thank you, Leonard.

The 1616 is a high-vacuum half-wave rectifier tube. That is what it is. To me, it looked like an amp tube plus the eBay seller headings use the word, "Amplifier" so I was expecting data on an amplifier tube, not a rectifier.

That's settled.

That was my first thought too; impressive.

The peak power for a very short time, is about 5 kilowatts, and the average power (where it must be operated for the most part), is still impressive at about 500 watts.
So it will easily handle a fairly high power transmitter, since two of them, sharing the power; are almost always used in the power supply.

Hi Lou;
I appreciate it, and I am tempted to raise my hand; but I already have its big brothers, and related equipment.
I am using type 866 and 872 in the power units.

I am finally at the point, where I have all the stuff I would need for most projects.
Too bad I still have four years to retirement yet, so progress is slow, and the honey-do list never goes away.
My brother as I have mentioned in a prior email, is retired, and is now pursuing his passion of a Lionel O gauge layout.

Now that I think about it, I have a jpg of me with a dozen of the fairly unusual tubes in my collection. All are very neat stuff.
It is part of a slide presentation.

I will round it up at home this weekend and email it.
Look up type 861 high power tetrode, of circa late 1930's. It was used in high power navy shipboard transmitter equipment, around war time.
A huge tube at 18 inches tall; you need both hands to hold it comfortably.

For those who are interested, there is the Delaware Valley Antique Radio show held at Renningers in Kutztown, about 10 miles from Allentown PA.
You will find any tube or equipment you have ever wanted, and at a fraction of the cost we see on the net. I attached the pdf.
Held twice a year, it is just weeks away on 9, 10 May.

Not for wimps, but for people who either build, restore, or want to see and buy beautifully finished sets.
Starting with the spark gap sets, and the oak cabinet regens of the early 1920's.

I bought a beautiful TRF radio in its cherry wood cabinet a few years ago.
Circa 1927, It's the only set that my wife lets me put out as furniture.

I sincerely suggest that everyone will thoroughly enjoy it. There is an auction at noon Saturday, where you can get good stuff even cheaper

Regards,
Louis 73's

I really enjoy the Kutztown meet. I have been going consistently for over 3 years now, twice a year. My youngest son (32) comes along with me to unload the boat anchors from my truck and help me out in general. In May, I will only be bringing my car, the truck is too much work. So, Louis, look for a white 2013 Chrysler 300C, in the overflow building (tables 631 & 633) and a guy with a gray beard and a beer gut, and that will be me.

As far as retirement, I am thinking next year when I hit 70, I'll probably retire. I have been working continuously since I was 13, so, it is time. Although, the Army pays me extremely generously to sit at home and do what I love, and, that will be hard to give up for a fixed income. 73 - Mike

9390. Crystal Filter adjustment procedures

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-03-29 22:25:27 UTC
From: JAMES HANLON
Topic: 9390 Message: 9390

Folks,

I'm involved in a discussion with the Editor and the Senior Assistant Technical Editor of QST and the author about the article published in the April issue of QST, "Crystal Phasing." I've tried the procedure outlined in the article under "Adjusting the Crystal Resonator Filter," and I've not been able to make it work. I've written up an alternate procedure that I believe will work on any receiver of any make that uses a vintage crystal filter.

I need some volunteers to try both procedures. It is entirely possible that I'm mistaken about the QST procedure, and I'd like to know that if I am. I'd also like to know if my procedure works, and I'd appreciate suggestions about how to make it better. It may eventually show up as a Technical Note in QST if the folks there can be convinced that there is a problem with the one that they published.

If you have a receiver with a vintage crystal filter, any make, and you would be willing to spend a little time trying out these two procedures, please let me know. I will respond with an email containing a copy of the QST article and a copy of my proposed procedure. I will report your results, whatever they may be, to the folks at QST.

Thanks very much,

Jim Hanlon, W8KGI

It is a nice job but wait til UPS/shipping gets done with it. That chassis (with the heavy iron at the rear) is secured only by the front panel. Without proper packing, ie. removing the power transformer, one drop upside down and the chassis will fold up against the front panel.

Robert;

I haven't viewed the circuit yet.
But it is not possible for regens to short out the ps, in normal design.

Check the wiring, especially the coil circuit, and the route from the pot.

Perhaps the schematic has an error.

Regens are the most forgiving of receivers.
Its actually hard to keep them from doing something, as soon as you turn on power.

You didn't say what frequency you are running at, but layout style and quality is not typically of concern.
I don't remember if this circuit uses a second tickler coil, on top of the main coil.
If that coil is reversed, then the circuit won't receive.

If you have the more common tapped coil (Hartley) approach, then there is no tickler, and direction is not an issue.

It is possible that the meshing variable capacitor plates may be bent and touch each other sometimes, but unlikely that this describes what is happening here.

Check the circuit.
There must be no way that the pot ever sees both sides of the ps, in a good circuit.

Hi Robert,

Can you attach the schematic? I can't get into the yahoo folders (don't ask).

To answer your question - yes, it could be a faulty pot, but it would be an unusual fault.

Does the receiver go into oscillation as you advance the regeneration control? You should be able to hear the point where it starts to oscillate in your 'fones - often described as a "plop."

Hi Louis,

I haven't seen the schematic yet (see my last post) either, but here is how the pot could conceivably short out the power supply.

If the set uses a tetrode or pentode, and regeneration is controlled by adjusting the voltage on the screen grid (a typical method), then one side of the pot is connected to ground, the other side /could/ be connected directly to B+, and the wiper of course attaches to the (bypassed) screen grid. If the pot had a failure such that at one extreme of rotation the wiper bridged the two "ends" of the pot, which would be unusual but not impossible, then B+ would be shorted to ground.

73,

Robert –

Verify that you have the pot connected properly. They usually have three connections, the two on either side is the whole resistive element and the one in the middle is the wiper. Aside from the failure mode that Larry mentioned, which should not happen but it may, if hooked up properly, the B+ should not be affected by the position of the pot. 73 – Mike

First, my thanks to Larry for his comments.

I was going to offer my take on the good and bad of control of the screen grid; but it is a triode.

So much for my typing up that response, and I was halfway through.

So; this is a standard circuit, the armstrong (if I remember correctly) regen circuit, with the tickler feedback coil.

I like these circuits; they are neat to work with and you can endlessly play with the circuit.

Ok, but we must remember to have the tickler coil in the right direction, or it won't work.

Robert mentioned that the radio did nothing.

Now the B+ is directly across the pot, for regeneration control by varying plate voltage.

Bad approach in putting B+ across a pot, but common in the old designs.

Note that high voltage also goes through your earphones too.

Even in the 1930's, some people did complain that this was a dangerous approach in a design.

Now, it was commented that if the pot were bad, it could short. Very true, but my gut feeling is that the pot started off as good.

if the pot were large enough for wattage, and high enough in resistance, there is no issue.

Now very often, there is a separate series resistor as a protection for a failing pot, but there is not one here.
Most of the pots in a circuit like this are designated as wire wound of a particular resistance.

But to tell the truth, I will still guess that there is a wiring error, or the pot burned out.
Probably by too low a resistance

My first recommendation, is to check the wiring.
Then maybe put in a beefier pot if this one is ok, and best protection of all; a series resistor with the pot.

But, let me say that I will never put a headset on with high voltage on it.

There are much safer designs, that were available.

Nice ones are seen in the journals, and the arrl handbooks of the 1940s and 50s.
I will dig up a favorite one; that I believe was from the 1955 handbook.

Let me invite comments on what to do next, from the group.

Regards,
Louis N3OL

Hi Robert,

Can you attach the schematic? I can't get into the yahoo folders (don't ask).

To answer your question - yes, it could be a faulty pot, but it would be an unusual fault.

Does the receiver go into oscillation as you advance the regeneration control? You should be able to hear the point where it starts to oscillate in your 'fones - often described as a "plop."

Just checked. The seller plans on removing the chassis and wrapping it up along side the case in the same carton side by side. So probably OK.

I hope you didn't make a connection at the point just above the 0.1uF cap. It's the only place on the diagram where the wires cross but are not connected.

Tnx to all for your comments. I apologize for the scarcity of details. I am building this circuit using a 6sn7 valve. I was not running B+ through the phones. I am using an old power transformer with the primary in place of the phones and connecting the 6.3v tap for the headphone connection.

I also can not find my stash of chokes. So I was attempting to use this circuit w/o the 5mH choke. How critical is it to the operation of the circuit?

First, my thanks to Larry for his comments.

I was going to offer my take on the good and bad of control of the screen grid; but it is a triode.

So much for my typing up that response, and I was halfway through.

So; this is a standard circuit, the armstrong (if I remember correctly) regen circuit, with the tickler feedback coil.

I like these circuits; they are neat to work with and you can endlessly play with the circuit.

Ok, but we must remember to have the tickler coil in the right direction, or it won't work.

Robert mentioned that the radio did nothing.

Now the B+ is directly across the pot, for regeneration control by varying plate voltage.

Bad approach in putting B+ across a pot, but common in the old designs.

Note that high voltage also goes through your earphones too.

Even in the 1930's, some people did complain that this was a dangerous approach in a design.

Now, it was commented that if the pot were bad, it could short. Very true, but my gut feeling is that the pot started off as good.

if the pot were large enough for wattage, and high enough in resistance, there is no issue.

Now very often, there is a separate series resistor as a protection for a failing pot, but there is not one here.
Most of the pots in a circuit like this are designated as wire wound of a particular resistance.

But to tell the truth, I will still guess that there is a wiring error, or the pot burned out.
Probably by too low a resistance

My first recommendation, is to check the wiring.
Then maybe put in a beefier pot if this one is ok, and best protection of all; a series resistor with the pot.

But, let me say that I will never put a headset on with high voltage on it.

There are much safer designs, that were available.

Nice ones are seen in the journals, and the arrl handbooks of the 1940s and 50s.
I will dig up a favorite one; that I believe was from the 1955 handbook.

Let me invite comments on what to do next, from the group.

Hi Robert,

Can you attach the schematic? I can't get into the yahoo folders (don't ask).

To answer your question - yes, it could be a faulty pot, but it would be an unusual fault.

Does the receiver go into oscillation as you advance the regeneration control? You should be able to hear the point where it starts to oscillate in your 'fones - often described as a "plop."

Best practice is to use the choke as well, as the bypass may not be 100% effective in keeping RF out of that part of the circuit. Belt & suspenders. It's reasonable to try it without the choke if you don't have a suitable one. I would think that the worst consequence would be passing some residual RF into the grid of the audio amp triode section, which could make it a bit squirrely or affect the audio. But you should still hear something.

Nope, the 47K resistor would be in series. So there would be 49K (assuming 2Kohm 'fones) across the 90V B+ if the regen pot were advanced to full-tilt boogie. That's only 1.8 mA - hardly a "short." Back off the regen control and it's even less.

Well, then if the impedance of the 'fones is a few thousand ohms or more
you are unnecessarily attenuating the audio with the step-down ratio of
the 120V:6.3V xfmr. That ratio would work well if the Z of the 'fones
was around 500 ohms.

Hi Robert,
I suspect that the connection, to the wiper terminal of the pot, may have been reversed with the connection to the B+ end of the pot. Check carefully. Some old pots have a terminal configuration, that can be confusing.
Or, there may be a short circuit (solder bridge?), between the B+ end of the pot, and the wiper connection.

Do you have an ohm meter??

I understand that you are using a transformer, between the audio amp & the phones. Good plan, imho. In addition to the possible shock hazard, I have read that the DC plate current, thru the phones, can gradually degrade the magnet, in the headphones, causing a loss of sensitivity.

From: Poli, Louis (US SSA)
Topic: 9394 Message: 9424

Ron;
Thanks for the guidance.
I would like to build upon your points further.

An ohmmeter is a must, and very cheap.
Actually they call them multimeters.

These have different scales; so you can measure ohms, volts, amps, etc. There is a harbor freight store near me.

They have multimeters for 6 dollars.
During a very good dollar sale in January, they were $3. each.

I bought 6 and commited them to watch voltage and current on some projects of mine.

I checked these very inexpensive units against a good wavetech multimeter; and they agreed closely.
Radio shack and Sears have meters too; a bit more expensive.

Now in reference to the choke; we remember that any coil is an inductor.
With a subclass of them known as RF chokes.

Since you are using a transformer to work with the earphones.
You can do other things as well, if you have more of them.

I just measured four speaker audio transformers that I pulled out presently from the junk box.

I read the inductance of the primary. Keep the secondary unconnected.

The numbers were 1.3, 1.7, 2.3, and 3.5 Henrys.

So the typical loud speaker transformer will have a few thousand millihenrys of inductance, and can be used as big chokes.

Also; the interconnection from the first half of the 6SN7(regen tube), to the second half of the tube; (typically running as a small audio amplifier), is typically via a large inductor.

Audio voltage appears across this inductor, and is amplified.

This transformer type is often designated to be as large as possible.

They often quote 8 to 10 Henrys. However these numbers are just guide lines.
This radio will work on less than one Henry.

Now on the rf choke needed to isolate the DC line from the RF. These big chokes will do fine there too.

If you have a number of small value chokes, you can add their values together.
Remember that inductors add like resistors, meaning, just connect them in series.

Capacitors do not add this way. They add their values together when they are connected together in parallel.

On the headphones; you can leave them out entirely.

If you are using a speaker transformer to match the tube plate to the headphones; then just use them as they were intended; to drive a speaker.

Do we have the power to drive a speaker.
More than enough, and I have done this in the regen 6SN7 based radios I have built.

Then why the earphones?

In some ways historical.
The old tubes were much poorer amplifiers, with less power output.
My two 6SN7 based regens were from the one tube regen article in the 1955 arrl handbook.
That radio circuit was very close to this design.

Speakers were expensive, and very different than the ones we use.

Regards,
Louis N3OL

Hello all,

I am attempting to build a regen based on the twinplex circuit. I can not get anything in the way of a signal. How critical is the construction of the coil? The other problem is if I turn the regen control to minimum it shorts the power supply to ground. Is this a faulty pot? the schematic is in a folder titled KG4KGL

Tnx

Louis –

One does need to be careful when using RF chokes and especially if placing them in series. Even audio ones. One becomes an issue due to construction and it has to be remembered that chokes of any sort have a self-resonance due to the distributed capacitance within. It is not desirable to use a choke whose resonance is in the band of interest. Self-resonance needs to be much higher than the frequency of use. Above resonance the choke acts like a capacitor. 73 – Mike

Subject: Re: [AWA Group] Trouble with a regen project...

Ron;
Thanks for the guidance.
I would like to build upon your points further.

An ohmmeter is a must, and very cheap.
Actually they call them multimeters.

These have different scales; so you can measure ohms, volts, amps, etc. There is a harbor freight store near me.

They have multimeters for 6 dollars.
During a very good dollar sale in January, they were $3. each.

I bought 6 and commited them to watch voltage and current on some projects of mine.

I checked these very inexpensive units against a good wavetech multimeter; and they agreed closely.
Radio shack and Sears have meters too; a bit more expensive.

Now in reference to the choke; we remember that any coil is an inductor.
With a subclass of them known as RF chokes.

Since you are using a transformer to work with the earphones.
You can do other things as well, if you have more of them.

I just measured four speaker audio transformers that I pulled out presently from the junk box.

I read the inductance of the primary. Keep the secondary unconnected.

The numbers were 1.3, 1.7, 2.3, and 3.5 Henrys.

So the typical loud speaker transformer will have a few thousand millihenrys of inductance, and can be used as big chokes.

Also; the interconnection from the first half of the 6SN7(regen tube), to the second half of the tube; (typically running as a small audio amplifier), is typically via a large inductor.

Audio voltage appears across this inductor, and is amplified.

This transformer type is often designated to be as large as possible.

They often quote 8 to 10 Henrys. However these numbers are just guide lines.
This radio will work on less than one Henry.

Now on the rf choke needed to isolate the DC line from the RF. These big chokes will do fine there too.

If you have a number of small value chokes, you can add their values together.
Remember that inductors add like resistors, meaning, just connect them in series.

Capacitors do not add this way. They add their values together when they are connected together in parallel.

On the headphones; you can leave them out entirely.

If you are using a speaker transformer to match the tube plate to the headphones; then just use them as they were intended; to drive a speaker.

Do we have the power to drive a speaker.
More than enough, and I have done this in the regen 6SN7 based radios I have built.

Then why the earphones?

In some ways historical.
The old tubes were much poorer amplifiers, with less power output.
My two 6SN7 based regens were from the one tube regen article in the 1955 arrl handbook.
That radio circuit was very close to this design.

Speakers were expensive, and very different than the ones we use.

Hi Robert,
I suspect that the connection, to the wiper terminal of the pot, may have been reversed with the connection to the B+ end of the pot. Check carefully. Some old pots have a terminal configuration, that can be confusing.
Or, there may be a short circuit (solder bridge?), between the B+ end of the pot, and the wiper connection.

Do you have an ohm meter??

I understand that you are using a transformer, between the audio amp & the phones. Good plan, imho. In addition to the possible shock hazard, I have read that the DC plate current, thru the phones, can gradually degrade the magnet, in the headphones, causing a loss of sensitivity.

Regen progress report: last night I looked over the circuit. The pot is wired correctly, but it is now defective. It is a new one but I do not think it is properly rated for this particular circuit. I did see where I had a wiring error involving the transformer for the phones. Until the pot gave out, I was hearing static. I was not able to tune any stations in. I think I have to many turns in the tuning coil (there are 20t, 1.25" dia form).

Mike;

I have an experiment at the bottom of the write-up.
Let me know what you think of the setup, and I invite others comments as well.

Mike has noted a good point, and this one is easy to miss.
I don't know the answer presently for this audio part.
Crossing over the slippery slope where the distributed capacitance now competes with your coil, has unexpectedly ruined the day for many designs. God has forsaken the designer.

For those unfamiliar with this issue; the inductor (a choke is a 1920's term for an inductor that is set up to "choke off" some frequencies, while letting others through) has a type of math representation that looks, for discussion sake, like a curve that is rising upwards.
But like most things in nature, and to again oversimplify for discussion sake, it has a mirror.

That mirror image is the capacitor.
A capacitance is simplistically, a curve going in the other direction.
Resonance, is the place where inductance cancels capacitance, and if you set it up in a particular way, the signal you want becomes strongest here.
This is where we want them, and is why and how we are able to "tune in" a radio station.

Resonance is mathematically a violent place; where the inductance curve runs quickly upwards to infinity. Then as the frequency is further increased, it reverses direction at one single frequency point (resonance) and dives down from infinity to look normal again.
It can be interpreted that this downward moving curve is capacitance.

Now if you are unfortunate enough to choose a choke coil whose value encourages a reversal to occur (a resonance frequency) where you don't want one, and wish to operate, then you now have exactly the opposite of what you want this part to do.
It now stops helping, but starts looking like a capacitor and becomes a hindrance.

Of course, there will always be a reversal someplace.
The idea is to make sure that it doesn't happen where your radio is tuning.

In the real world, any physical length of wire, anything, is an inductor; and any wire that comes relatively near to another wire creates capacitance. These values are usually so small (we call them distributed and parasitic) that the reversal happens at some very high frequency, well away from where you are looking for stations.

But as Mike points out, how do you know that in this huge part with so much wire running next to so much of itself, over and over; there will not be a resonance where you don't want one.

The answer is that you don't know; without analyzing.

For this part, analysis is quite difficult because you need to make guesses.
In the real world, where it will actually work, we sweep it across all frequencies, with the proper test equipment, to show there is indeed nothing nearby.
Now let me say that my gut feeling is that in this case, the odds are well with us, because the radio band is quite low, and parasitic values should put the reversal quite high up.
But like I said, the “odds” are with us, and nothing more.
And for completeness, it should be said that this radio is so primitive that resonances should not be of any consequence.

Now, it’s about time we had some fun with this project.
Let’s sweep this beast in the real world; and see if there is anything.

Mike;
I will let the secondary remain open circuit/unconnected.
I will short the primary together, and we sweep the primary in frequency.
This is reasonable since the secondary is unused and open in our radio.

Now actually, I will add two small turns of wire and short the primary through this.
This is such a small departure, that it is invisible.
We need it, so that the test equipment can see what is going on, but not interfere.

For those interested, we are going to use a RIGOL “Spectrum Analyzer with Tracking Generator”.
Google the type DSA 800 series, and this is the DSA 815 TG.
These things are basically a powerful receiver that visually shows you what signals it sees, and from different perspectives.
An often indispensable instrument for really serious radio work.

Let me say that they are not free either.
And I must thank my wife, for consenting to my finally buying one.

Robert;

One combination I remember is about 140 turns on a toilet tissue or Scott towel roll.
This, when connected to the very typical 365 pf variable capacitor which I think you are using should bring it into the am band.

This is the capacitor that you see in almost every tube AM/FM radio you will find.
Once we get this thing to play in the AM band, then all else is easy.

Now disconnect the antenna completely, and move the wire away from the regen.
Also remember that this is a primitive radio. And one of its issues is that it is influenced by many things around it.
The antenna attached to the radio will change the frequency and also perhaps take enough power from the radio to stop regeneration. So we eliminate this part.

Put the radio in regeneration now, so that it hisses in your earphones.
You will know this when the radio suddenly jumps from a little hiss to a heavy rushing noise and/or squeal.
It is a fine point, and you cannot miss it, if, it is regenerating

These radios also make the devils' own noise.
It will create jamming interference at the frequency you have it tuned to.

Bring an AM radio nearby, and tune your regen radio variable capacitor until you hear a strong rushing noise in the am radio.
Tune the capacitor over its whole range to find this.
The noise will probably knock off the station that may be playing on the am radio.
If you don't hear the jamming noise in the AM radio band somewhere; then you are not in the AM band, or it is still not regenerating (oscillating). Alternatively, you can tune the AM radio until you bump into the regen receiver frequency, but I do not find this method convenient.

Now keep in mind that it is possible that as you are tuning the variable capacitor over its range, you may run into spots where the radio stops regenerating.
Always look out for this.

Raise the regeneration control further until you are sure it is regenerating (oscillating) again.

Also be aware that chances are that the nearness of your hand to the capacitor as you are tuning it will affect it.
I mean that if you tune it, and then move your hand away, the frequency will move a little.
Your hand is a good capacitor and you become part of the tuned circuit. It is just an annoyance.

Now I have added the attached jpegs of my own radio which is probably a very close duplicate of yours.
Your radio has to look much better than this one.

I listen to Cuba, China, and BBC every time I am in my shop building some other radio.
I find this more fun than the others.

I presently have had to add them as jpg attachments to the email.
Let me know I you can see them.

Regen progress report: last night I looked over the circuit. The pot is wired correctly, but it is now defective. It is a new one but I do not think it is properly rated for this particular circuit. I did see where I had a wiring error involving the transformer for the phones. Until the pot gave out, I was hearing static. I was not able to tune any stations in. I think I have to many turns in the tuning coil (there are 20t, 1.25" dia form).

Hello Louis,

I will give that a go. Here is my regen. I built it in an Eico RF signal generator.

From: Mike Feher
Topic: 9433 Message: 9436

Louis –

With an inductor, the distributed capacitance make is a parallel tuned circuit. At resonance, ideally it has infinite impedance. Real easy to test for with a signal generator and a scope or an RF voltmeter. If placed in series it will act as a zero of transmission and in parallel with a circuit it will be a pole. So, depending how one hooks it up, self-resonance can be easily found by either looking for a null or a peak while manually tuning the signal generator. 73 – Mike

Subject: RE: [AWA Group] Trouble with a regen project...an experiment to test the choke

Mike;

I have an experiment at the bottom of the write-up.

Let me know what you think of the setup, and I invite others comments as well.

Mike has noted a good point, and this one is easy to miss.

I don’t know the answer presently for this audio part.

Crossing over the slippery slope where the distributed capacitance now competes with your coil, has unexpectedly ruined the day for many designs. God has forsaken the designer.

For those unfamiliar with this issue; the inductor (a choke is a 1920’s term for an inductor that is set up to “choke off” some frequencies, while letting others through) has a type of math representation that looks, for discussion sake, like a curve that is rising upwards.

But like most things in nature, and to again oversimplify for discussion sake, it has a mirror.

That mirror image is the capacitor.

A capacitance is simplistically, a curve going in the other direction.

Resonance, is the place where inductance cancels capacitance, and if you set it up in a particular way, the signal you want becomes strongest here.

This is where we want them, and is why and how we are able to “tune in” a radio station.

Resonance is mathematically a violent place; where the inductance curve runs quickly upwards to infinity. Then as the frequency is further increased, it reverses direction at one single frequency point (resonance) and dives down from infinity to look normal again.

It can be interpreted that this downward moving curve is capacitance.

Now if you are unfortunate enough to choose a choke coil whose value encourages a reversal to occur (a resonance frequency) where you don’t want one, and wish to operate, then you now have exactly the opposite of what you want this part to do.

It now stops helping, but starts looking like a capacitor and becomes a hindrance.

Of course, there will always be a reversal someplace.

The idea is to make sure that it doesn’t happen where your radio is tuning.

In the real world, any physical length of wire, anything, is an inductor; and any wire that comes relatively near to another wire creates capacitance. These values are usually so small (we call them distributed and parasitic) that the reversal happens at some very high frequency, well away from where you are looking for stations.

But as Mike points out, how do you know that in this huge part with so much wire running next to so much of itself, over and over; there will not be a resonance where you don’t want one.

The answer is that you don’t know; without analyzing.

For this part, analysis is quite difficult because you need to make guesses.

In the real world, where it will actually work, we sweep it across all frequencies, with the proper test equipment, to show there is indeed nothing nearby.

Now let me say that my gut feeling is that in this case, the odds are well with us, because the radio band is quite low, and parasitic values should put the reversal quite high up.

But like I said, the “odds” are with us, and nothing more.

And for completeness, it should be said that this radio is so primitive that resonances should not be of any consequence.

Now, it’s about time we had some fun with this project.

Let’s sweep this beast in the real world; and see if there is anything.

Mike;

I will let the secondary remain open circuit/unconnected.

I will short the primary together, and we sweep the primary in frequency.

This is reasonable since the secondary is unused and open in our radio.

Now actually, I will add two small turns of wire and short the primary through this.

This is such a small departure, that it is invisible.

We need it, so that the test equipment can see what is going on, but not interfere.

For those interested, we are going to use a RIGOL “Spectrum Analyzer with Tracking Generator”.

Google the type DSA 800 series, and this is the DSA 815 TG.

These things are basically a powerful receiver that visually shows you what signals it sees, and from different perspectives.

An often indispensable instrument for really serious radio work.

Let me say that they are not free either.

And I must thank my wife, for consenting to my finally buying one.

Louis –

One does need to be careful when using RF chokes and especially if placing them in series. Even audio ones. One becomes an issue due to construction and it has to be remembered that chokes of any sort have a self-resonance due to the distributed capacitance within. It is not desirable to use a choke whose resonance is in the band of interest. Self-resonance needs to be much higher than the frequency of use. Above resonance the choke acts like a capacitor. 73 – Mike

Subject: Re: [AWA Group] Trouble with a regen project...

Ron;
Thanks for the guidance.
I would like to build upon your points further.

An ohmmeter is a must, and very cheap.
Actually they call them multimeters.

These have different scales; so you can measure ohms, volts, amps, etc. There is a harbor freight store near me.

They have multimeters for 6 dollars.
During a very good dollar sale in January, they were $3. each.

I bought 6 and commited them to watch voltage and current on some projects of mine.

I checked these very inexpensive units against a good wavetech multimeter; and they agreed closely.
Radio shack and Sears have meters too; a bit more expensive.

Now in reference to the choke; we remember that any coil is an inductor.
With a subclass of them known as RF chokes.

Since you are using a transformer to work with the earphones.
You can do other things as well, if you have more of them.

I just measured four speaker audio transformers that I pulled out presently from the junk box.

I read the inductance of the primary. Keep the secondary unconnected.

The numbers were 1.3, 1.7, 2.3, and 3.5 Henrys.

So the typical loud speaker transformer will have a few thousand millihenrys of inductance, and can be used as big chokes.

Also; the interconnection from the first half of the 6SN7(regen tube), to the second half of the tube; (typically running as a small audio amplifier), is typically via a large inductor.

Audio voltage appears across this inductor, and is amplified.

This transformer type is often designated to be as large as possible.

They often quote 8 to 10 Henrys. However these numbers are just guide lines.
This radio will work on less than one Henry.

Now on the rf choke needed to isolate the DC line from the RF. These big chokes will do fine there too.

If you have a number of small value chokes, you can add their values together.
Remember that inductors add like resistors, meaning, just connect them in series.

Capacitors do not add this way. They add their values together when they are connected together in parallel.

On the headphones; you can leave them out entirely.

If you are using a speaker transformer to match the tube plate to the headphones; then just use them as they were intended; to drive a speaker.

Do we have the power to drive a speaker.
More than enough, and I have done this in the regen 6SN7 based radios I have built.

Then why the earphones?

In some ways historical.
The old tubes were much poorer amplifiers, with less power output.
My two 6SN7 based regens were from the one tube regen article in the 1955 arrl handbook.
That radio circuit was very close to this design.

Speakers were expensive, and very different than the ones we use.

Louis N3OL

Subject: Re: [AWA Group] Trouble with a regen project.

Hi Robert,
I suspect that the connection, to the wiper terminal of the pot, may have been reversed with the connection to the B+ end of the pot. Check carefully. Some old pots have a terminal configuration, that can be confusing.
Or, there may be a short circuit (solder bridge?), between the B+ end of the pot, and the wiper connection.

Do you have an ohm meter??

I understand that you are using a transformer, between the audio amp & the phones. Good plan, imho. In addition to the possible shock hazard, I have read that the DC plate current, thru the phones, can gradually degrade the magnet, in the headphones, causing a loss of sensitivity.

Mike;

Nice.

This method will not be as quantitative as using the tracking generator.
And where I have the benefit of calibrating and leveling everything out of the system except the inductor. I miss nothing.
But that kind of measurement power is not necessary get a reasonable yes/no over the band of interest.

I'll set up the parallel circuit and look for the pole; an easier circuit to deal with.
The price; is that the input output ports need to see high impedances; so as not to degrade the Q further, as it may be already poor (maybe).
And if already poor, I may miss the resonance.

The scope and RF voltmeter probes will offer a high impedance.
The 50 ohm signal generator will not.

What series resistance would you recommend at the sig gen port, to avoid influencing the Q.

Off hand, I recommend approx. 20 K, which is good enough to disengage the 50 ohm equipment when testing the old IF cans at 455 KHz.
But they have sharp peaks to begin with.

Also, varying the sig-gen output from 1 MHz to 30 should cover the possibilities.

Does this BW work for you.

Louis –

I myself at this time have no interest in experimenting with this as I have done this many times in the past. Keep the DCR of the inductor in mind. If you are going to use the resonant circuit as a pole, then, you will essentially shunt that 20K series resistor to ground, and, greatly attenuate the sig gen output. Testing it as a zero is a lot easier as you can drive it with the low impedance of the sig gen and then terminate it with about 1K prior to the scope or meter. The frequency range of course is dependent on your use, and, may go down into audio as well. Also, typically, a null is easier to find than a peak.

As far as test equipment, I can do just about anything up to about 100 GHz. That includes both network and spectrum analysis. NF up to about 50 GHz and so on. Cannot even walk in my lab now, too much equipment, HI. 73 – Mike

But that kind of measurement power is not necessary get a reasonable yes/no over the band of interest.

I’ll set up the parallel circuit and look for the pole; an easier circuit to deal with.

The price; is that the input output ports need to see high impedances; so as not to degrade the Q further, as it may be already poor (maybe).

And if already poor, I may miss the resonance.

The scope and RF voltmeter probes will offer a high impedance.

The 50 ohm signal generator will not.

What series resistance would you recommend at the sig gen port, to avoid influencing the Q.

Off hand, I recommend approx. 20 K, which is good enough to disengage the 50 ohm equipment when testing the old IF cans at 455 KHz.

But they have sharp peaks to begin with.

Also, varying the sig-gen output from 1 MHz to 30 should cover the possibilities.

Does this BW work for you.

Louis –

With an inductor, the distributed capacitance make is a parallel tuned circuit. At resonance, ideally it has infinite impedance. Real easy to test for with a signal generator and a scope or an RF voltmeter. If placed in series it will act as a zero of transmission and in parallel with a circuit it will be a pole. So, depending how one hooks it up, self-resonance can be easily found by either looking for a null or a peak while manually tuning the signal generator. 73 – Mike

Subject: RE: [AWA Group] Trouble with a regen project...an experiment to test the choke

Mike;

I have an experiment at the bottom of the write-up.

Let me know what you think of the setup, and I invite others comments as well.

Mike has noted a good point, and this one is easy to miss.

I don’t know the answer presently for this audio part.

Crossing over the slippery slope where the distributed capacitance now competes with your coil, has unexpectedly ruined the day for many designs. God has forsaken the designer.

For those unfamiliar with this issue; the inductor (a choke is a 1920's term for an inductor that is set up to "choke off" some frequencies, while letting others through) has a type of math representation that looks, for discussion sake, like a curve that is rising upwards.

But like most things in nature, and to again oversimplify for discussion sake, it has a mirror.

That mirror image is the capacitor.

A capacitance is simplistically, a curve going in the other direction.

Resonance, is the place where inductance cancels capacitance, and if you set it up in a particular way, the signal you want becomes strongest here.

This is where we want them, and is why and how we are able to "tune in" a radio station.

Resonance is mathematically a violent place; where the inductance curve runs quickly upwards to infinity. Then as the frequency is further increased, it reverses direction at one single frequency point (resonance) and dives down from infinity to look normal again.

It can be interpreted that this downward moving curve is capacitance.

Now if you are unfortunate enough to choose a choke coil whose value encourages a reversal to occur (a resonance frequency) where you don't want one, and wish to operate, then you now have exactly the opposite of what you want this part to do.

It now stops helping, but starts looking like a capacitor and becomes a hindrance.

Of course, there will always be a reversal someplace.

The idea is to make sure that it doesn't happen where your radio is tuning.

In the real world, any physical length of wire, anything, is an inductor; and any wire that comes relatively near to another wire creates capacitance. These values are usually so small (we call them distributed and parasitic) that the reversal happens at some very high frequency, well away from where you are looking for stations.

But as Mike points out, how do you know that in this huge part with so much wire running next to so much of itself, over and over; there will not be a resonance where you don't want one.

The answer is that you don't know; without analyzing.

For this part, analysis is quite difficult because you need to make guesses.

In the real world, where it will actually work, we sweep it across all frequencies, with the proper test equipment, to show there is indeed nothing nearby.

Now let me say that my gut feeling is that in this case, the odds are well with us, because the radio band is quite low, and parasitic values should put the reversal quite high up.

But like I said, the "odds" are with us, and nothing more.

And for completeness, it should be said that this radio is so primitive that resonances should not be of any consequence.

Now, it’s about time we had some fun with this project.

Let’s sweep this beast in the real world; and see if there is anything.

Mike;

I will let the secondary remain open circuit/unconnected.

I will short the primary together, and we sweep the primary in frequency.

This is reasonable since the secondary is unused and open in our radio.

Now actually, I will add two small turns of wire and short the primary through this.

This is such a small departure, that it is invisible.

We need it, so that the test equipment can see what is going on, but not interfere.

For those interested, we are going to use a RIGOL “Spectrum Analyzer with Tracking Generator”.

Google the type DSA 800 series, and this is the DSA 815 TG.

These things are basically a powerful receiver that visually shows you what signals it sees, and from different perspectives.

An often indispensable instrument for really serious radio work.

Let me say that they are not free either.

And I must thank my wife, for consenting to my finally buying one.

Louis –

One does need to be careful when using RF chokes and especially if placing them in series. Even audio ones. One becomes an issue due to construction and it has to be remembered that

chokes of any sort have a self-resonance due to the distributed capacitance within. It is not desirable to use a choke whose resonance is in the band of interest. Self-resonance needs to be much higher than the frequency of use. Above resonance the choke acts like a capacitor. 73 – Mike

Subject: Re: [AWA Group] Trouble with a regen project...

Ron;
Thanks for the guidance.
I would like to build upon your points further.

An ohmmeter is a must, and very cheap.
Actually they call them multimeters.

These have different scales; so you can measure ohms, volts, amps, etc. There is a harbor freight store near me.

They have multimeters for 6 dollars.
During a very good dollar sale in January, they were $3. each.

I bought 6 and commited them to watch voltage and current on some projects of mine.

I checked these very inexpensive units against a good wavetech multimeter; and they agreed closely.
Radio shack and Sears have meters too; a bit more expensive.

Now in reference to the choke; we remember that any coil is an inductor.
With a subclass of them known as RF chokes.

Since you are using a transformer to work with the earphones.
You can do other things as well, if you have more of them.

I just measured four speaker audio transformers that I pulled out presently from the junk box.

I read the inductance of the primary. Keep the secondary unconnected.

The numbers were 1.3, 1.7, 2.3, and 3.5 Henrys.

So the typical loud speaker transformer will have a few thousand millihenrys of inductance, and can be used as big chokes.

Also; the interconnection from the first half of the 6SN7(regen tube), to the second half of the tube; (typically running as a small audio amplifier), is typically via a large inductor.

Audio voltage appears across this inductor, and is amplified.

This transformer type is often designated to be as large as possible.

They often quote 8 to 10 Henrys. However these numbers are just guide lines.
This radio will work on less than one Henry.

Now on the rf choke needed to isolate the DC line from the RF. These big chokes will do fine there too.

If you have a number of small value chokes, you can add their values together.
Remember that inductors add like resistors, meaning, just connect them in series.

Capacitors do not add this way. They add their values together when they are connected together in parallel.

On the headphones; you can leave them out entirely.

If you are using a speaker transformer to match the tube plate to the headphones; then just use them as they were intended; to drive a speaker.

Do we have the power to drive a speaker.
More than enough, and I have done this in the regen 6SN7 based radios I have built.

Then why the earphones?

In some ways historical.
The old tubes were much poorer amplifiers, with less power output.
My two 6SN7 based regens were from the one tube regen article in the 1955 arrl handbook.
That radio circuit was very close to this design.

Speakers were expensive, and very different than the ones we use.

Hi Robert,
I suspect that the connection, to the wiper terminal of the pot, may have been reversed with the connection to the B+ end of the pot. Check carefully. Some old pots have a terminal configuration, that can be confusing.
Or, there may be a short circuit (solder bridge?), between the B+ end of the pot, and the wiper connection.

Do you have an ohm meter??

I understand that you are using a transformer, between the audio amp & the phones. Good plan, imho. In addition to the possible shock hazard, I have read that the DC plate current, thru the phones, can gradually degrade the magnet, in the headphones, causing a loss of sensitivity.

Hello all,

I am attempting to build a regen based on the twinplex circuit. I can not get anything in the way of a signal. How critical is the construction of the coil? The other problem is if I turn the regen control to minimum it shorts the power supply to ground. Is this a faulty pot? the schematic is in a folder titled KG4KGL

Tnx

Hi Mike;
Nice Lab!
So let me assume that you do work at millimeter wave.
My condolences! Hi Hi.

I did some work at 54 and 94 some time ago, but I am happy to return to around the L band; which I swear looks like DC, compared to up there.

I must say though, that have always been fascinated by the radically different approaches that must be taken in that region, at least for what we did here.

Dielectric waveguides made of ruby; transitions that are almost not-seeable; and integrated GaAs diodes that yet have a flying structure, so that most of it remains in the air. Blessed amazing.
That is the stuff that I would like to have seen more of and continued research.

But the testing itself and getting results were so difficult to duplicate, and sometimes the data hard to believe.
Chasing these things down the rabbit hole, often took the fun out of it.
And maybe this is heresy, but I don't believe that the ADS simulators can be given enough good modeling data, and that's the problem, to give the level of goodness that people expect.

But on this transformer thing. I must disagree this time.
And I hope I have understood your response in the proper context.

I have measured resonances before, and if I have a choice (agreed that it is subjective), have always been more comfortable with the shunt 2 port circuit.

But you are right, indeed a zero is pretty blessed final; and a high impedance is arbitrary; as it always opens itself up to "how high" is adequate.
So I can't claim the better method, I just like the parallel circuit

Now the 20 K resistor will be, relatively, shunted to ground only when there is no resonance in the device. But the resonance condition is what we are looking for, so it is of no consequence.
Indeed it should never be an issue for this application, since the 20 K (when shunted to ground) compared to the low impedance source of 50 ohms can never load that source.
So the signal should remain at a level, slowly changing if at all.

But the series resistance of the inductor; I was so used to the very low resistance of the typical inductors I use, that I haven't given it a great deal of thought.
But the odds are with me, so we shall see.

A neat give-take discussion Mike; I don't get enough of them.
I'll check it out and see what it does.

Louis –

I myself at this time have no interest in experimenting with this as I have done this many times in the past. Keep the DCR of the inductor in mind. If you are going to use the resonant circuit as a pole, then, you will essentially shunt that 20K series resistor to ground, and, greatly attenuate the sig gen output. Testing it as a zero is a lot easier as you can drive it with the low impedance of the sig gen and then terminate it with about 1K prior to the scope or meter. The frequency range of course is dependent on your use, and, may go down into audio as well. Also, typically, a null is easier to find than a peak.

As far as test equipment, I can do just about anything up to about 100 GHz. That includes both network and spectrum analysis. NF up to about 50 GHz and so on. Cannot even walk in my lab now, too much equipment, HI. 73 – Mike

In response to a recent posting, that described a regen receiver as a beast that that howls, squeals, jumps into oscillation with a plop, and/or creates a broadband noise in another nearby receiver. IMO, this description applies to a regen rx, that is not performing correctly, and will not perform its intended function, well.
These symptoms indicate of a squegging detector (oscillation on MULTIPLE frequencies, instead of the desired single freq).
Such behavior is somewhat characteristic of a super regen detector, but not a well performing straight regen.

>jumps into oscillation with a plop

With my own (but limited) regen work I have found that the iconic 'plop' may also be a sign of less-than-ideal performance. With some careful work with voltages, feedback, and finer control over the regeneration (either pot or varicap), the transition into oscillation comes in not with a 'plop', but with a gradual change in the noise characteristic. Sensitivity can be quite astounding at the sweet spot *just* as the noise character begins to change.

Louis –

The DCR of an RF choke is only a few tenths of an ohm, if that much. I realize that off of resonance Xl will be high, but, still feel that a lot of the RF will be shunted to ground with 20K from the generator in a shunted configuration. Let us know when you play with it, how it turns out. BTW, before I had all this test equipment about 30 or more years ago, when I built a filter, I always choose an Elliptic. They were real easy to tune up by just peaking the poles and nulling the zeroes. Sometimes I used a wideband noise source in place of the sig gen. Thanks & 73 – Mike

Robert - although component-thrifty compared with the TPTG, the TNT is a little trickier to optimize as the grid coil must be carefully tweaked for best efficiency, power output and note quality. I suspect it was popular because it could be built with a minimum part count. I agree that it is not the easiest design for a newcomer.

Yep - but it's not THAT bad. The first transmitter I ever built was the TNT, in 1981.

Besides its simplicity, it was popular because there was one less control to deal with to put it on frequency: "single control," similar to the Hartley. (I guess they didn't count the loading breadslicer.)

Topic: 9452 Message: 9452

Robert;
Forgive the "war and peace" write-up length, but this may be the full reason.
It was technical, on why the TNT will never compete with the tptg, and so it got long, real fast.

I think my answer below may be on the mark; but I can't know for sure if this is what they were thinking of.

But very simply; I believe they were discouraging the use of this oscillator for potential new users, because it was falling out of technological favor.

Stability is the key, truly and absolutely.
Oscillator instability shows itself as drifting around the chosen frequency (for us).
The result was that two transmitters would have to be farther apart in frequency to avoid jamming each other.
So an unstable (relatively) transmitter would limit the number of users of the band, and artificially crowd it.

Now, an oscillator is a natural non-linear device.
Any nonlinear device generates noise, and instability (and other deeper parameters) contributes to this.

Not only does the noise artificially crowd the band; but mathematically (and not easy to see how, without the math) is that noise will appear everywhere, even on frequencies relatively far from the transmitter frequency.
So now everyone' receivers listening in much of the band will see more noise too, limiting their ability to receive weak signals.
This is true, even though the offending transmitter is not even close by in the band.

We call this a rising of the "noise floor".
Think of the noise floor as a swimming pool where a little splashing in a corner raises the entire water level a few feet and drowns everyone across the entire pool.

The tptg oscillator is argued as more complicated and more costly than the TNT.
So people would prefer to use the TNT, all things being equal.

But they are not equal.
The easiest to understand engineering reason for this, is this concept of L-C ratio (inductor-capacitor).
You can oscillate it at the same frequency with a large C and small L; or a large L and small C.
The combination must simply give resonance at the frequency you wish.

The tptg resonant circuits can run at relatively high C values, and so, use a lower L.
The TNT resonant circuit must use a lower value of C, by design, and so has a higher value of L to make it resonant at the same frequency.

Now, in the real world, an L will always be compromised and never be a perfect component, because it has inescapable DC and RF resistance (and some other deeper things).
The surface area of the wire used is limited to some practical value.

The more surface, the less resistance to the RF current.
RF flows on top of surfaces of the wire, and not through the wire.
A hollow pipe will conduct an RF current as well as a solid core one.

Now also in the real world, the capacitor C, can be fairly easily made to near perfection, because the DC and RF resistance in this device is almost absent. Two plates face each other, with no connection (other deeper reasons too).
Now the RF currents face very little resistance.

We can largely say that the so called "Q" of a coil-capacitor resonator is driven by the resistance in the circuit.
Let me simplify a bit a say that Q and better stability are directly related.

Then a high C circuit, with low L (high Q); will always be more stable than a low C circuit, with the required high L (low Q).
In the real world, the TNT cannot compete.

It is interesting to see that there is always; always, a price to pay.
The simpler cheaper circuit cannot compete in the important area.

Louis N3OL

To: AWA
Subject: [AWA Group] Oscillator question

Today at lunch I was reading a Lindsey reprint of the 1936 Radio Handbook. In the section covering the different oscillator circuits. It said the TNT should be avoided by newcomers.

I thought that was the easiest to build and operate, unlike the TPTG where you have to tune both the plate and the grid. What is their reasoning for that statement?

Robert

The plate tank is; the grid tank is not. Therefore the plate tank "takes over" and sets the frequency.

However, I take exception to the statement that the "the TNT can't compete." It can compete very well among all the other oscillator-transmitters (so-called "self-excited" transmitters), such as the Hartley, Colpitts, TPTG, Meissner, etc.

The TNT grid tank circuit consists of the grid coil and the parasitic capacitances in the grid coil and the tubes. There is no discrete capacitor, but those smaller capacitances are there. Hi L, Lo C => low Q. Therefore the resonance is very broad, unlike the plate tank, which is hi C low L, which is therefore high in Q and tunes sharply.

Thank you, Larry. The best description on this that I have read. A keeper...

I'm carrying on three concurrent Es this evening. Between them I re-read War and Peace (and nicely written too, Louis) and see that I had missed the plural, "circuits" and therefore my question.

The tptg resonant circuits can run at relatively high C values, and so, use a lower L.

This is a 20 mtr rig. Note the 1000mmfd. grid condenser.

Not sure what you mean, Louis.

I thought we were talking about LC power oscillator transmitters - as such, the Hartley and Colpitts were most definitely used and contemporaries of the TNT and TPTG, in the 1920s and early 1930s.

There is a classic QST article, by George Grammer W1DF IIRC, that compares all the circuits and basically concluded that if you build and operate them correctly, any one of them is as good as the other. If someone doesn't beat me to it, I'll find the reference.

Hi Robert,
The TNT and TPTG are actually closely related cousins. Both must be adjusted/tuned, if optimum results are to be achieved.
The difference is that the grid tank circuit of the TNT is adjusted to (near) resonance only by the tube input capacitance, plus stray capacitances.
The TPTG uses a small value adjustable cap, in addition to the tube input capacitance + strays, that the TNT uses.
IMHO, the handbook statement was based on the concept that fine tuning the TPTG only requires that the capacitor shaft be rotated. The TNT is optimised by pruning the inductor (by adding or removing turns), to fine tune the grid tank circuit (this does not occur at exact resonance). The former would be more quickly and easily accomplished by those of us that are mere mortals.

I suspect that the lack of a conveniently adjusted grid circuit may have been more of a problem, back in the days of yore, when the CW activity was probably more spread out (frequency wise), than it is today?? A large QSY would require a readjustment, if optimum results were to be obtained, over the entire frequency range.
Note that a TPTG or TNT oscillator may function to some degree, with a less than optimum adjustment, but the quality of the note, and the plate conversion efficiency (output power vs dc input power) will not be optimum.

As a sidebar, I am preparing a number of jpgs to put in an email soon.

I had promised Louis and I think Mike, some time ago that I would show some of the tubes that I have in my collection.

Now one of the pieces is a Pliotron tetrode.

The RCA Pliotron class are tubes that were used primarily as very high power oscillators. Kilowatt oscillator circuits for special use.

So it looks like that picture email of mine that I am crafting is going to be a timely addition to the conversation.

But now, yes my mistake, and I see that I was certainly unclear.

Yes the colpitts etc., are indeed used but an example of why the tnt may be said to be as good as they, would be helpful.

However, the QST article you cite seems to be just what is needed.
I have the qst library.
Can you point me to a year or thereabouts, and I'll find it quickly.

Louis

Hi Louis (and list),

The article was by Hull and starts on page 9 of the August 1928 issue of QST, "Overhauling the Transmitter for 1929." He mentions the TPTG, Colpitts and Hartley oscllators as (so-called) "self-excited" transmitters. I don't believe he mentions the TNT, which of course is just the TPTG with a broadly-tuned grid tank. His conclusion on page 11 is "all standard self-excited circuits, irrespective of how carefully designed and built they may be, are equally and any time capable of producing truly wretched signals. And, conversely, that all such circuits, when correctly arranged and tuned, can be made to produce signals that are veritably above criticism."

Then he goes on to describe the construction of a Hartley transmitter using a single '10, the classic "Hull Hartley" that several on this list have built and used.

Happy reading and 73,
-Larry/NE1S

Guys,

I've always used a Hartley for my 1929-style transmitters because of the limited part count, so the only direct experience I have with TNTs is listening to them on the air. But I seriously doubt that the TNT or any of the other classic oscillator circuits produces "noise" beyond its oscillating frequency. I have certainly never heard any such noise from my Hartleys. That sounds like the kind of thing that a digitally synthesized oscillator would generate.

Does anyone else have any experience of this broadband noise?

Jim,

I concur. If not properly tuned and loaded these things can generate
broad signals for various reasons, but nothing I would classify as
"broadband noise." I suppose if you were to use a very loose definition...

ditto here. I've found a well adjusted TNT to sound just as good as the (much easier to adjust) Hartley. I doubt that is the reason why newcomers were discouraged from builing them. Broadband noise was the least of their problems back then.

Subject: Re: [AWA Group] Oscillator question... a technical reason

Not sure what you mean, Louis.

I thought we were talking about LC power oscillator transmitters - as such, the Hartley and Colpitts were most definitely used and contemporaries of the TNT and TPTG, in the 1920s and early 1930s.

There is a classic QST article, by George Grammer W1DF IIRC, that compares all the circuits and basically concluded that if you build and operate them correctly, any one of them is as good as the other. If someone doesn't beat me to it, I'll find the reference.

On 4/4/14 6:38 PM, Louis Vermond wrote:

Then a high C circuit, with low L (high Q); will always be more stable than a low C circuit, with the required high L (low Q). In the real world, the TNT cannot compete.
Yes, Louis, but isn't the TNT's tank a hi-Q circuit? Lou

_
The plate tank is; the grid tank is not. Therefore the plate tank "takes over" and sets the frequency.

However, I take exception to the statement that the "the TNT can't compete." It can compete very well among all the other oscillator-transmitters (so-called "self-excited" transmitters), such as the Hartley, Colpitts, TPTG, Meissner, etc.

For the TNT it's all here Lou, under 'Grid Circuit Optimization':

http://members.shaw.ca/ve7sl/tnt.html

As for the Hartley, it's just a matter of finding the correct tank tap point and not overcoupling the antenna.

Hello everyone

I am very happy that I found your group! My name is Mike and I have been WA8RVD since 1963. I love vintage radio and QRP. About a year ago I found a Pilot Super Wasp, got it working and decided that a transmitter was needed to go with it. Decided on a TNT and started my parts search. While searching e-bay I discovered an original p-p TNT complete with tubes but missing a couple of other parts. I have attached photos. And I now have all the parts to build the TNT I set out to build a year ago! Then I found this group! All of this is why I am so very happy!

73,

Mike

Nope! No matter how careful you are there will be a residue of fine steel fibers. The Brass wool is somewhat more coarse and not a prone to shedding. The Scotch Brite comes in different grits and can be differentiated by color. If memory serves the white is the lightest and Purple is the most coarse. An old, well used kitchen Scotch Brite works well.

Roger.

When polishing generator commutators we always used flint sand paper or brush stone because steel wool and carborundum would embed in the copper and either short the commutator bars or cause excessive wear on the brushes, or both. I've heard that antenna wires should be periodically polished with sand paper too.

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-04-08 18:29:24 UTC
From: Poli, Louis (US SSA)
Topic: 9495 Message: 9495

Ron;
As always, I appreciate any comments from our membership.
That’s why I signed up in September.

Maybe my words are overly strong (?).
It’s hard to get a flavor of something through an email.

I saw Steven’s email yesterday, where he commented that the rcvr is extremely sensitive.
Yes and I have actually been able to receive Europe (in good propagation conditions) in my basement without an antenna.

I drive these things hard.
This receiver is of course an oscillator, and the oscillation (by nature extremely non-linear) provides the means of detection and unfortunately, the severe side effect of powerful harmonics and intermods.

Unfortunately, and I do this too, even though I know it’s bad to some level; is to basically all use it as directly connected to the antenna.

The receiver is dirty, and without any design attempt to filter the harmonics and the like.
And connecting it to the antenna, without buffering it with something, like perhaps an RF amp before it (which is a favorite way of separating noisy stages from the antenna), puts the harmonics and intermods noise all over the place with little attenuation.

I can run 150 volts which is reasonable, to more than 300 volts on the plate of the 6sn7, to make it louder, etc.
Yes, the tube is now overheating and may not see a good service run, but that is ok.

Now actually I do run this thing very often in this high voltage condition.
But maybe this heavy power condition is making the transition to oscillation much more dramatic as well, and so the sounds, that I reported in the email.
Maybe; as I haven’t checked this out.

Now because I am clearly making things worse this way, I watch the output with a spectrum analyzer, and one can see all this interference.
True enough on the results of squegging, but I can at least avoid this.
Being able to see the signal, I can set the oscillation to a region where it can oscillate without breaking into uncontrolled hopping and simultaneous oscillation in many places at the same time.
Therefore, I can see and eliminate the squegging that you alluded to; and which would have been perfectly possible, if I could not see the signal on the instruments.

Now in fact, I do not reign in the squegging tendency with the regen control.
I use almost exclusively, the Armstrong “top hat’ feedback coil design, which Robert is using in his circuit.
It gives so much leeway in setting the regen condition.

One needs to be careful, and it is not easy to find a single good place, for the entire band.
Now I simply back off the top hat farther from the tank coil until regeneration can be brought on; but is controllable, for lack of a better word.
Having said that , it also allows you to bring on the squegging and other problems quite easily too.

Armstrong technique is also nice in that it is less temperamental than using the coil tap technique of the Hartley.
I built a Hartley regen several years ago, and actually have some good picture that can put in an email. I was unhappy with the design, for these various weaknesses.
The theory/circuits section on oscillators in the ARRL handbook, had warned the reader to be ready for some level of difficulty from the Hartley.

But let me sidebar a bit.
I have not built a superregen, but have been reading up on it, on and off for some time.
Actually most of this good reading material for me, comes out of the Radio Handbooks "Editors and Engineers" of the 1930s and further into the forties.

The write-up on the effects of the supersonic interruption of the straight regen rcvr; noted that a claim to fame for this device, is that it is quieter for a given reception and sensitivity.
In experience, do you find the circuit sensitive to tune and stabilize, so as to avoid the performance weaknesses of the plain regen?

Regards,
Louis N3OL

To: AWAGroup@yahoogroups.com
Subject: RE: [AWA Group] Trouble with a regen project.....but do not despair

In response to a recent posting, that described a regen receiver as a beast that that howls, squeals, jumps into oscillation with a plop, and/or creates a broadband noise in another nearby receiver. IMO, this description applies to a regen rx, that is not performing correctly, and will not perform its intended function, well.
These symptoms indicate of a squegging detector (oscillation on MULTIPLE frequencies, instead of the desired single freq).
Such behavior is somewhat characteristic of a super regen detector, but not a well performing straight regen.

Ah. Someday I'll buy a set of those. Not only for obvious reasons but it also happens to be the year of my birth. I've often thought of assembling a station representative of that year. It's probably one of those projects I'll never get to.

Lou, Quite a find. Will you have it running in December? Niel - W0VLZ

Hi Niel & thank you.

Yes, quite a job as well.

When I posted those photos was hoping to both entertain and begin a conversation (read, pick brains) on its restoration.

At this point the main question involves the repainting of the front panel. Not the painting as such, that's the easy part, but maintaining the engraved lettering visibility.

As with the NC-101X, the front panel was first painted then the letters engraved leaving the exposed metal as the infill "paint". You see the problem I'm sure.

Any suggestions on how to overcome the problem?

Will you have it running in December? Not likely to have it completely restored by then, but may get on the Kelley for a few using only the osc. Well within the 10W legal limit!

73, Lou

Just a wild thought.... There is a product we called 'red rubber' that was a liquid rubber. It
was thin enough that you could apply it with a brush, do your painting etc., and then just pick
out the rubber. If the old paint was removed from the panel first, you could just paint a blob
over the engraving and then use a razor blade to cut off any material above the surface. Less
tedious than filling each letter individually!

Probably available at your local craft supply store. Comes in a bottle, sometimes with a brush
in cap.

I've been thinking on this also lately. One concern with any substance filling the engraving is if the paint might flake away from the edges of the engraving when the rubber is removed (?). How about lightly coating the engraved recesses with a release agent of sorts -- say a light oil? After painting, the engravings may still be somewhat visible and you can begin removing the poorly-adhered paint (hopefully) and carefully clean up the edges of the engraving with suitable tools and magnification.

Tks Steve. Another to add to the Word file. There is the using of oil based paint as with dials, but the wrinkle finish may cause problems with excess paint removal.

Below is a second rig that came with the deal, the Cat. 218. Because the variable cap are crumbling, it will become a 215 parts source. Tomorrow I'll sand blast away its panel paint and begin experimenting with these suggested methods.

Any more? Now's the time.

Someone please tell me about pot metal. I've known for years that it is dreaded, but that's all.

73, Lou

Modified from 210s to 6F6/804

I was very careful in removing it yet...

Lou -

Pot metal is junk. Literally!! It's typically a bunch of left-over scraps melted down into an
alloy that has a low melting temperature. Usually it's mostly Zinc, but all bets are off on what else is in there. The low melting temperature makes it attractive for casting pieces because the forms don't have to withstand the much higher temperatures required to cast iron or ...

The result is a porous, weak metal that deteriorates with age and can't realistically be soldered or welded because we don't know what metal it 'really' is!! :-)

In many applications parts can be replaced with cast epoxy resin pieces, which can now be stronger than pot metal. Of course they are non-conductive.......

For one or two pieces it's probably more realistic to machine something out of aluminum if the
shape can be duplicated. CNC milling can do wondrous things.. Perhaps the new 3-D printers will give us a better option!!

If there's a foundry near you, you might be able to get some green molding sand from them. I did that once, to make new hood hinges for my TR-3. I melted a bunch of beer cans and poured them into the mold and they came out better then the originals.

Leonard

Interesting stuff!! Pricey... $59 + $9 shipping for 5 18" rods and a bottle of flux.

Low melting point (350 degrees F) but no mention about strength.

Gentlemen,

One of the reasons Zinc was used as a casting material is it's ability to take a mold form easily. One of the reasons it is used in casting auto carburetors. I can't speak to "pot" metal. I'd guess pot metal might have Antimony, Bismuth or Lead. Antimony and Tin are used to harden Lead.

Roger.

Tks Garey.

In many applications parts can be replaced with cast epoxy resin pieces, which can now be stronger than pot metal. Of course they are non-conductive.....
For one or two pieces it's probably more realistic to machine something out of aluminum if the shape can be duplicated. CNC milling can do wondrous things..

Perhaps the new 3-D printers will give us a better option!! Or maybe Scottie can whip sumpin up?

If there's a foundry near you, you might be able to get some green molding sand from them. I did that once, to make new hood hinges for my TR-3. I melted a bunch of beer cans and poured them into the mold and they came out better then the originals. Leonard

Lou - are you familiar with JB Weld? It's a two-part epoxy for metal...this stuff is exceptional strong and it may well put those caps back together. It's widely available in hardware stores. 7UV

There are problems. The condenser did not break, it crumbled so repairing is not really, as I see it, feasible.

The 215's variables seem to have held up well though. They may be all right for moulds or machining samples, yet is it wise to subject one to such a use? As well, the 215's Jewell meter is shot so will have use the 218's meter (100 milliamp). Then there are two 215 RFCs missing so the 218 will have to supply those along with a few of the Cardwells. There is a case, but the rig sat in an inch of water at some point so the bottom of the case is heavily rusted (but not through) and the plywood base is separating. So, is it worth a restoration?

No personal experience here, but I've heard of Vaseline being used for this purpose. Whatever you use it must be in the engravings only; I would use a sqeegee of some kind to apply it and then carefully go over the nearby flat surfaces, on which you want the paint to adhere, with a light rag dampened with solvent (such as paint thinner or turpentine), before painting.

9531. RE: [AWA Group] Trouble with a regen.....It ’s good to be able to see the signal

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-04-11 20:50:38 UTC
From: Ron Barlow
Topic: 9531 Message: 9531

Hi Louis,

Please excuse the delayed reply. I have not been home very much, during the past several days, and I have fallen behind with everything.

I regret that I am unable to provide any useful input, re the design of a super regen receiver. I "threw together" one or 2 VHF super regens, many years ago. I believe that I used it/them to listen to FM BC stations and TV audio, before they were disassembled to allow the use of the components for some other project, that is in the long ago forgotten category. Thus, my very limited experience, with super regens, is only an extremely dim memory!

Are you using 150-300 volts on the plate of the regen detector stage, Louis, or are you referring to the plate voltage on an audio amp stage, that follows the detector?

The references, that I have read, suggest using no more than 20 or 30 volts, on the plate of a triode regen detector, or on the screen grid of a tetrode/pentode detector, and my limited experience seems to agree with that info.

If you are experiencing stability problems, with your regen, I suggest that you try using ~ 25 volts on the plate of your detector. You will undoubtedly have to use a larger # of turns on the "tickler" winding, to achieve oscillation, and the audio output will not be as great (on strong stations), but I believe that the overall performance will probably be better. You can always add more audio amplification, to increase the audio level. This scheme will very probably yield better performance, vs using high plate voltage on a triode detector.

I found that I had to add a second stage of audio amplification, to hear the weaker stations reasonably well, in my (all to often) high ambient noise environment. Actually, I find that I could often use even more audio gain, that the 2 RC coupled triode (low mu types)stages offer. I would have to add some sort of audio limiting, however, to avoid having my ear drums shattered, during the reception of stronger sigs.

Subject: RE: [AWA Group] Trouble with a regen.....It’s good to be able to see the signal
To: "AWAGroup@yahoogroups.com" <AWAGroup@yahoogroups.com>
Date: Tuesday, April 8, 2014, 11:29 AM

Ron;
As always, I
appreciate any comments from our membership.

That’s why I
signed up in September.

Maybe my words are
overly strong (?).

It’s hard to get a
flavor of something through an email.

I saw Steven’s
email yesterday, where he commented that the rcvr is
extremely sensitive.

Yes and I have
actually been able to receive Europe (in good propagation
conditions) in my basement without an antenna.

I drive these things
hard.

This receiver is of
course an oscillator, and the oscillation (by nature
extremely non-linear) provides the means of detection and
unfortunately, the severe
side effect of powerful harmonics and intermods.

Unfortunately, and I
do this too, even though I know it’s bad to some level; is
to basically all use it as directly connected to the
antenna.

The receiver is
dirty, and without any design attempt to filter the
harmonics and the like.

And connecting
it to the antenna, without buffering it with something, like
perhaps an RF amp before it (which is a favorite way of
separating noisy stages
from the antenna), puts the harmonics and intermods noise
all over the place with little attenuation.

I can run 150 volts
which is reasonable, to more than 300 volts on the plate of
the 6sn7, to make it louder, etc.

Yes, the tube is now
overheating and may not see a good service run, but that is
ok.

Now actually I do
run this thing very often in this high voltage
condition.
But maybe this heavy

power condition is making the transition to oscillation much more dramatic as well, and so the sounds, that I reported in the email.
Maybe; as I haven't checked this out.

Now because I am clearly making things worse this way, I watch the output with a spectrum analyzer, and one can see all this interference.
True enough on the results of squegging, but I can at least avoid this.

Being able to see the signal, I can set the oscillation to a region where it can oscillate without breaking into uncontrolled hopping and simultaneous oscillation in many places at the same time.
Therefore, I can see and eliminate the squegging that you alluded to; and which would have been perfectly possible, if I could not see the signal on the instruments.

Now in fact, I do not reign in the squegging tendency with the regen control.
I use almost exclusively, the Armstrong "top hat' feedback coil design, which Robert is using in his circuit.

It gives so much leeway in setting the regen condition.
One needs to be careful, and it is not easy to find a single good place, for the entire band.
Now I simply back off the top hat farther from the tank coil until regeneration can be brought on; but is controllable, for lack of a better word.
Having said that , it also allows you to bring on the squegging and other problems quite easily too.

Armstrong technique is also nice in that it is less temperamental than using the coil tap technique of the Hartley.
I built a Hartley regen several years ago, and actually have some good picture that can put in an email. I was unhappy with the design, for these various weaknesses.

The theory/circuits
section on oscillators in the ARRL handbook, had warned the reader to be ready for some level of difficulty from the Hartley.

But let me sidebar a
bit.
I have not built a
superregen, but have been reading up on it, on and off for some time.

Actually most of
this good reading material for me, comes out of the Radio Handbooks "Editors and Engineers" of the 1930s and
further into the forties.

The write-up on the
effects of the supersonic interruption of the straight regen rcvr; noted that a claim to fame for this device, is that it is quieter for
a given reception and sensitivity.
In experience, do
you find the circuit sensitive to tune and stabilize, so as to avoid the performance weaknesses of the plain
regen?

Regards,
Louis

So you did, Mike. Scary stuff there. Assuming Yahoo lets this link through (no bets on that), here's something more scary. You don't want to run into this on a dark night, HI !

Thank you, Larry for your suggestion.

I stripped the 218s panel today using PolyStrippa. Although most of the paint wiped away easily enough there was still a bit of the paint left. On a whim I soaked a rag with methyl hydrate and ...zip, the residue was gone.

REL's shop practice was a bit slap-dash. Most of the scratches you see were under the paint.

I'll begin trying the suggested hints& kinks tomorrow.

73, Lou

9540. Re: [AWA Group] Trouble with a regen.....It ’s good....B+ and superregens.

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-04-12 23:04:07 UTC
From: Poli, Louis (US SSA)
Topic: 9531 Message: 9540

Hi Ron;
I have not been keeping up either; with palm Sunday and Easter almost here.

I have to go again, in a short time too.

But first; thanks for sharing your experiences with the superregen type equipment.

In one of my "editors and engineers" handbooks (same format as the arrl books), I saw some neat superregens using the 955, 966 type acorn tubes. It was vhf to uhf.
Fascinating performance. What tubes and texts did you use?

On the B+ for my current regens, I never considered that the tubes could run as low as 20 to 30 volts on the plate.
But when I was a young boy, I used 45 and 90 volt batteries to power 2 tube receivers like the favorite 1T4 det, with its 1S4 pwr amp.
Now in the present, I didn't think that you could go almost half again lower and still get gain and current from the plate.

As it has worked well for you, I'll lower the B+ and take a look at my 2 regens.

One is Hartley (with the coil tap at the first few turns of the tank coil.
And the other is the Armstrong (feedback top hat coil) type.

Now on the question of 300 volts on the plates.

Your question is exactly what I would have asked.
True enough, it is customary to run only the pwr amps at 250 and above.

I actually do run the plates of the detector, as well as the following amplifier, at the same B+.
That is; 150 to 300 volts.

The curious part of all this is that I have, never seen, any text that required running at 30 volts and lower.
Now let me exclude the very early types that ran with 45 volt batteries, and 1.5 volt (D cell battery.

Every other design I have seen uses a very typical 180 volts or thereabouts.
Most of my interests are in radios that use power supplies; and so where high voltage is easy to prepare.

But I have not seen any discussions on deliberately lowering it again to duplicate a clean low voltage battery, for performance.

I will scan and pdf the designs and docs, and put them in another email.

Need to go presently, and i'll catch up with the correspondence next week.

Regards,
Louis

Subject: RE: [AWA Group] Trouble with a regen.....It’s good to be able to see the signal

Hi Louis,

Please excuse the delayed reply. I have not been home very much, during the past several days, and I have fallen behind with everything.

I regret that I am unable to provide any useful input, re the design of a super regen receiver. I "threw together" one or 2 VHF super regens, many years ago. I believe that I used it/them to listen to FM BC stations and TV audio, before they were disassembled to allow the use of the components for some other project, that is in the long ago forgotten category. Thus, my very limited experience, with super regens, is only an extremely dim memory!

Are you using 150-300 volts on the plate of the regen detector stage, Louis, or are you referring to the plate voltage on an audio amp stage, that follows the detector?

The references, that I have read, suggest using no more than 20 or 30 volts, on the plate of a triode regen detector, or on the screen grid of a tetrode/pentode detector, and my limited experience seems to agree with that info.

If you are experiencing stability problems, with your regen, I suggest that you try using ~ 25 volts on the plate of your detector. You will undoubtedly have to use a larger # of turns on the "tickler" winding, to achieve oscillation, and the audio output will not be as great (on strong stations), but I believe that the overall performance will probably be better. You can always add more audio amplification, to increase the audio level. This scheme will very probably yield better performance, vs using high plate voltage on a triode detector.

I found that I had to add a second stage of audio amplification, to hear the weaker stations reasonably well, in my (all to often) high ambient noise environment. Actually, I find that I could often use even more audio gain, that the 2 RC coupled triode (low mu types)stages offer. I would have to add some sort of audio limiting, however, to avoid having my ear drums shattered, during the reception of stronger sigs.

Ron;
As always, I
appreciate any comments from our membership.

That’s why I
signed up in September.

Maybe my words are
overly strong (?).

It’s hard to get a
flavor of something through an email.

I saw Steven’s
email yesterday, where he commented that the rcvr is
extremely sensitive.

Yes and I have
actually been able to receive Europe (in good propagation
conditions) in my basement without an antenna.

I drive these things
hard.

This receiver is of
course an oscillator, and the oscillation (by nature
extremely non-linear) provides the means of detection and
unfortunately, the severe
side effect of powerful harmonics and intermods.

Unfortunately, and I
do this too, even though I know it’s bad to some level; is
to basically all use it as directly connected to the
antenna.

The receiver is
dirty, and without any design attempt to filter the
harmonics and the like.

And connecting
it to the antenna, without buffering it with something, like
perhaps an RF amp before it (which is a favorite way of
separating noisy stages
from the antenna), puts the harmonics and intermods noise
all over the place with little attenuation.

I can run 150 volts
which is reasonable, to more than 300 volts on the plate of
the 6sn7, to make it louder, etc.

Yes, the tube is now
overheating and may not see a good service run, but that is
ok.

Now actually I do
run this thing very often in this high voltage
condition.
But maybe this heavy

power condition is making the transition to oscillation much more dramatic as well, and so the sounds, that I reported in the email.
Maybe; as I haven't checked this out.

Now because I am clearly making things worse this way, I watch the output with a spectrum analyzer, and one can see all this interference.
True enough on the results of squegging, but I can at least avoid this.

Being able to see the signal, I can set the oscillation to a region where it can oscillate without breaking into uncontrolled hopping and simultaneous oscillation in many places at the same time.
Therefore, I can see and eliminate the squegging that you alluded to; and which would have been perfectly possible, if I could not see the signal on the instruments.

Now in fact, I do not reign in the squegging tendency with the regen control.
I use almost exclusively, the Armstrong "top hat' feedback coil design, which Robert is using in his circuit.

It gives so much leeway in setting the regen condition.
One needs to be careful, and it is not easy to find a single good place, for the entire band.
Now I simply back off the top hat farther from the tank coil until regeneration can be brought on; but is controllable, for lack of a better word.
Having said that , it also allows you to bring on the squegging and other problems quite easily too.

Armstrong technique is also nice in that it is less temperamental than using the coil tap technique of the Hartley.
I built a Hartley regen several years ago, and actually have some good picture that can put in an email. I was unhappy with the design, for these various weaknesses.

The theory/circuits
section on oscillators in the ARRL handbook, had warned the reader to be ready for some level of difficulty from the Hartley.

But let me sidebar a
bit.
I have not built a
superregen, but have been reading up on it, on and off for some time.

Actually most of
this good reading material for me, comes out of the Radio Handbooks "Editors and Engineers" of the 1930s and
further into the forties.

The write-up on the
effects of the supersonic interruption of the straight regen rcvr; noted that a claim to fame for this device, is that it is quieter for
a given reception and sensitivity.
In experience, do
you find the circuit sensitive to tune and stabilize, so as to avoid the performance weaknesses of the plain
regen?

Regards,
Louis

Lou,

I think it's a cool gadget but really don't need one. Maybe someone else will want to play with it.

Something about this is just cool, I think I need a tone filter and I had better go with the No. 1945 to keep the cost down.

Thanks for sharing.

9572. Another TNT-but with a twist

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-04-26 15:09:33 UTC
From: Kevin Carey
Topic: 9572 Message: 9572
Attachments: 1 described; binary payloads are missing from this source WARC

Hello all,

In chatting with Lou Vermond, VE3AWA, he suggested that I share the following story about my TNT transmitter with the AWA Group. I have also attached a photo of the rig, which I hope will make it along with the message. Many thanks to Lou for providing me with a reduced size image to use...

I like to think the most unique thing about my TNT is that Bruce Kelley personally helped me build it. I live in Bloomfield, NY where Bruce resided for many years. Back in 1995, I contacted him for advice on where I might obtain the parts to build such a project. He told me to come on over, and upon my arrival he handed me a cardboard box, saying "Here, you'll need this." From this point we went into his carriage barn (where the fledgling AWA Museum had once been housed). It was like a trip back in time. As the December snow was piling up outside, he went to various areas of the barn picking up the parts I would need, including beehive insulators, a Cardwell air-variable cap, tank coil, Fahnstock clips, etc. He even gave me a type 10 tube, as well as a type 01A for use in the circuit.

Although I wanted to use the type 10 tube, the vintage project plans offered an alternative for those lacking the funds to build a full-powered transmitter, due to the cost of a more complex power supply and the larger tube. I figured that back in '29 I would have been in no better shape than most people of the era, so I opted for the low power version of the rig. It runs about two watts DC input by my measurements, and although it's no powerhouse, I do have a fair amount of success with it when conditions are right. A few years ago, I even managed to contact Steve VE7SL, out on the west coast very late at night on 80m.

One thing I do with my rig that I've not heard of anyone else doing is bandswitching. I made up two short jumpers with alligator clips (shown in the attached photo) and I short out roughly half the tank coil and half the grid coil and go on 40 meters! It may be horribly inefficient--I don't know--but I do make contacts and that is what's important to me. In the last '29 event, I actually made more contacts on 40m than I did on 80. Perhaps I worked some of you reading this. I wonder why more folks don't use this crude form of bandswitching. By the way, this xmtr was built from plans in the book, How to Become a Radio Amateur, 1930 edition, which I obtained from Lindsay Publications.

73, and see you on the air!

Lou -

I just went through the 20's, and Clayton was the Assistant Technical Editor from only early
1926 through part of 1927. Interestingly NONE of the article authors and Staff have their calls
listed.! Even the ones I know had calls. Clayton had at least one article a month in QST during this period, but none referenced a call..... guess you need a 20's Callbook....

Apparently the '1DQ' call was his Connecticut call while he was Assistant Technical Editor of
QST in 1926.

9592. John M. Clayton 5ZL / 1DQ Why I asked.

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-04-30 02:45:41 UTC
From: Louis Vermond
Topic: 9592 Message: 9592

Thank you, Gary, Steve, Steve & Paul. You too, Mike.

There are two REL Cat. No.175 Hartley transmitters shown in a scanned REL catalogue that I have. It was the second and, I am assuming, later version that I restored last fall.

From that catalogue, the earlier No.175 rig is shown below. (Also, see attachments.)

Note the Cardwell variables (I.e., not REL.) and the #127 Type L transmitting coil that was split to make a tank and antenna loading coil.

Below from the 175 catalogue description.

Rig found in the above article by Clayton.

Why is this of interest to me? Recently I won a 175 transmitter on eBay which included the shipping box.
As you see, it's called out as a Type No. "W1BOC". Was this Clayton's call? As it turned out, the mystery continues.

From its parts list, the rig is complete.

Steve & Don please note..

9593. Another TNT-but with a twist ... Many thanks, Kevin

Many thanks, Kevin for introducing your TNT to the Group. As I recall saying before, it is very "clean".

Please run through your experiences with the initial testing. For example, finding the correct grid coil inductance. Are you using a series variable capacitor with the antenna loading ?
You mention questionable efficiencies when shorting out tank/grid coil turns to change bands. What are differences between input and output? Have you used capacitive coupling to a load? If so, what was the outcome? How about smoke? Smoke always adds to the story.

Tks agn, Lou VE3AWA

Lou -

In the 1926/27 frame, Clayton was at ARRL and his call was definitely 1DQ. W1BOC doesn't come
up in a universal QST author search.

Lou -

Check <http://www.newsm.org/Wireless/wireless.html>!

W1BOC was Louis Carini, a 'noted wireless pioneer'.

In the 1926/27 frame, Clayton was at ARRL and his call was definitely 1DQ. W1BOC doesn't come
up in a universal QST author search.

I guess you like older women Larry, HI.

Reminds me of when I lived in Florida. From mid-1974 to mid-1976 when my new bride and daughter moved to Sarasota as I accepted a position there. So, at the time I was almost 29 when we got there and moved to VA when I was almost 31. Met a lot of neat old hams down there. I remember this one old ham, was probably in his mid-60's at the time, but, certainly a lot older than I was, who had a problem with his 2 meter rig. By then I sort of built up a god reputation of being a collector and an engineer who could fix things. So, he brought over his 2 meter rig, and, I was able to fix it for him. We started talking about old age. I remember him telling me that he realized that he was getting older when more and more grandmothers looked sexier and sexier. Being pretty young then, I did not really appreciate what he was telling me. Now, that I am close to 69, I know exactly what he meant.

FB, Mike!

Although in this I wasn't paying as much attention to the woman as I was the equipment and schematic on the wall. (Admittedly, usually it would be the other way around. Maybe I'm getting old, too!).

From: Bill Stewart
Topic: 9603 Message: 9603

While searching thur my coil form stock, I ran across a coil with
a Gross Radio sticker on it...appears to be unmodified. It has abt
15 turns and on a 4 pin form. The sticker has in pencil, 80...
an 80m coil? Anyone need it for a Gross rig?

9605. Variable Capacitors: SLW, SLF or SLC

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-05-02 21:29:19 UTC
From: Bill Stewart
Topic: 9605 Message: 9605

Good Afternoon,
The Subj. terms crop up with me on occasion. In this case I am looking
for a couple of Cardwells (rcvr type) or equiv. with around 365-400 uuF.
The use will be in a simple one tube osc (xmtr). For the purpose of plate
and ant. loading I am thinking that the SLC would be proper. Am I right? Or,
for this use does it make any real diff. I can see that for rcvr use the
proper config should be selected for proper tracking, calib., etc . I think
these terms has something to do with the shape of the capacitor plates.
Can anyone point me to info on the proper use of the SLW, SLF, and
SLC variables.
Tnx...73 de Bill K4JYS

Gentlemen,

I was intrigued by Larry's pix of the girl wireless operator. As a bit of trivia: Within 5 days of the Battle of Gettysburg (July 1-3, 1863). The Union Army had landline operators in the town. One was a female.

Topic: 9605 Message: 9607

Cardwells (rcvr type) or equiv. with around 365-400 uuF. The 17-plate Cardwell 152B is 14-380pF according to the catalog.

thinking that the SLC would be proper. Am I right? I would not use a SLF or SLW cap for tuning the self-excited oscillators. I used one on my TNT and it is far too touchy near full mesh – which is where it needs to be to provide the proper high-capacity. SLC would work best here since it will ideally be used near the full mesh end of its tuning range. SLC also work well in tuning networks such as pi, T. or L nets.

proper use of the SLW, SLF, and SLC variables. I have a great reference…somewhere. The SLW and SLF plate profiles are cut such that the wavelength or frequency, respectively, can be displayed evenly across a tuning dial, or as a linear line on a tuning chart. SLC plates cause increasing crowding of stations as the cap unmeshes (higher in frequency).

9608. Variable Capacitor nomenclature

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-05-03 22:39:16 UTC
From: JAMES HANLON
Topic: 9608 Message: 9608

SLC stands for "straight line capacitance." SLF stands for "straight line frequency." SLW stands for "straight line wavelength."

If you were using an SLC variable and the dial was calibrated in Capacitance units like picofarads, the dial divisions would all be the same across the dial scale.

If you were using an SLF variable and the dial was calibrated in Frequency units like Kilohertz or Megahertz, the dial divisions would be the same across the dial scale.

If you were using an SLW variable and the dial was calibrated in Wavelength units like Meters, the dial divisions would be the same across the dial scale.

From: Larry Szendrei
Topic: 9610 Message: 9610

Forwarded from the AM list, originally posted by Don Chester K4KYV today 5/7/14:

The following message was forwarded to me from Jerry Proc VE3FAB (E-mail: jerry.proc@... <mailto:jerry.proc@...> Web: http://jproc.ca)

This is a distress call to all enthusiasts of radio and radio history. The Radio Museum of Qu?bec located in Sorel, Qu?bec is in deep trouble. Some time ago , they had to vacate the existing premises where the radio collection was located. All artefacts were put into storage but no suitable site was ever found. Now the owner wants his tractor trailers back, all six of them.

The message below, sent a few weeks ago, did not result in a solution to save the radio collection at Mus?e Qu?b?cois de la radio inc. If a solution is not found within the next few days, the complete collection will go to the trash and will disappear at the end of the month. The collection is impressive. It contains over 1900 pieces of radio equipment and over three quarters of a million pages of documentation. The collection is presently stored on 130 pallets in six 53-foot trailers. The trailers are on loan and must be returned on the 31st of May. If storage space is not found, the entire collection could end up in the landfill. It was impossible to find a temporary warehouse for the collection. One solution was to purchase three or four used 53-foot trailers but the fund raising attempt did not generate enough funds. That option would have required at least $7,500.

Does anyone have any suggestions ? If no solution is found, can we save the collection by offering it to other museums in Canada? What to do on the 31st of May ? Open the trailers, let anyone take anything they want, and let the rest go to the dump? Return the trailers to the owners with the collection inside? The owner will certainly take the collection to the dump and invoice the Museum for the cost of disposal.

Here are the options:

Find a storage solution before the end of May

Donate the collection to other museums (must be picked up before the end of May)

Let anyone take what they want and send the rest to the dump

Send the entire collection to the dump

Abandoning the collection by returning the trailers with the collection inside

If you have any suggestions, or if you can help, please contact Jacques Hamel, VE2DJQ at: museeradio@...
<mailto:museeradio@...> Sorel-Tracy is within 75 kilometres (47 mi) of both Montr?al and Trois-Rivi?res, and is easily accessible via Autoroute 30 from the west and via Route 132 from the east and west.

A similar situation arose in Adelaide, South Australia two years ago when a local Council refused to renew an Aircraft & Radio Communications museum building lease because the dated building (owned by the Council!!) did not comply with 2012 Workplace Health & Safety Regulations. The cost of any alterations was expected to be borne by the museum; same situation: not enough funds raised to do that. The outcome was that the museum was closed on the due date; the museum committee contacted other museums around Australia plus authentic amateur radio clubs & some ''selected individuals'' (so items did not finish up on eBay!!) & as many items as possible were dispersed that way. The remainder was dumped. That was the second wireless/radio/communications museum in this State to go that route. The Postmaster Generals Department wireless, signalling & communication museum right in the middle of the Adelaide CBD was evicted due to property demand. The collection was broken up with most still stored in a caring individual's warehouse some 20 years later.

This is about the 20th time I saw this re-posted from Jerry Proc. For one thing, it is exactly why I would never donate to a museum. In my opinion, individual collectors appreciate the stuff a lot more within their group of friends/collectors than the general public in a museum anyway.

If it is really going to the dumpsters, then they must have been aware of it for a while rather than this last minute BS. Regardless, why do not sell off a part to collectors, raise some funds to pay for other temporary storage, now there would be less to store any way, until a final place can be located. Additionally, while it is in the temporary storage, the rest could be sold off to collectors, and, the funds could be donated to some charity or another museum. 73 ☐ Mike

I agree, Mike. It should never have gotten to this point, and I think the best solution is to get it into the hands of private collectors. I don't understand the aversion to Ebay - it's the free market at work, and the most likely outcome is the winner of the auction is the one who will appreciate the item the most, and therefore give it the best home. The only valid reason for shunning sale on Ebay or another venue is the considerable work involved in packing and shipping the item, or at least taking it to someone to do it (the buyer would pay for this service for it to work, obviously).

I re-posted it because it HAS gotten to the crisis stage, and I hate to see beautiful old gear being scrapped when there are people out there that would love to have it. My position is give it away if you have to, and if the person it's given to wants to turn a buck on it for his efforts, that's OK, and much preferable to the dumpster.

I agree, Mike. It should never have gotten to this point, and I think the best solution is to get it into the hands of private collectors. I don't understand the aversion to Ebay - it's the free market at work, and the most likely outcome is the winner of the auction is the one who will appreciate the item the most, and therefore give it the best home. The only valid reason for shunning sale on Ebay or another venue is the considerable work involved in packing and shipping the item, or at least taking it to someone to do it (the buyer would pay for this service for it to work, obviously).

I re-posted it because it HAS gotten to the crisis stage, and I hate to see beautiful old gear being scrapped when there are people out there that would love to have it. My position is give it away if you have to, and if the person it's given to wants to turn a buck on it for his efforts, that's OK, and much preferable to the dumpster.

This is about the 20th time I saw this re-posted from Jerry Proc. For one thing, it is exactly why I would never donate to a museum. In my opinion, individual collectors appreciate the stuff a lot more within their group of friends/collectors than the general public in a museum anyway.

If it is really going to the dumpsters, then they must have been aware of it for a while rather than this last minute BS. Regardless, why do not sell off a part to collectors, raise some funds to pay for other temporary storage, now there would be less to store any way, until a final place can be located. Additionally, while it is in the temporary storage, the rest could be sold off to collectors, and, the funds could be donated to some charity or another museum. 73 - Mike

Hello,

Last Friday morning my wife and I were on our way out of town for a 6 day driving trip. Stopped by the post office and, surprise, the rig was there. Returned home to drop it off. Hardest thing I ever did in my life was not to open the box before continuing our trip.

Returned home late last night, but decided to await a new day and a clear eye...second hardest thing I ever did.

Below are a few findings and points.

Inside the filament switch box was the original kit flashlight lamp for tuning the antenna coil to resonance. The filament is good.

"175" is in ink, "W1BOC" in pencil.

Below last week from OM Garey - K4OAH

Turns out that the rig was not designed for REL by W1BOC as I assumed, but purchased by him.

Just out of the original box. No damage...

The grid leak is 12K not 5K as called out in the catalogue description.
The buss wire from the underside of the Sangamo to the bracket is for support only.

In the sellers photo the RFC looked grungy unlike the rest of the rig. The winding was waxed making it a dirt magnet.

Buss / antenna coil connection. Nicely formed around the tanks ribbon, but never soldered.

Plate blocking condenser/tank winding connection to left of clip. Soldered, but loose.
These Engineers...I tell ya.

Series "C" Cardwells, #171-C / 350 mmfd.

After tracing the hook-up, tightening connections, verifying part values and measuring voltages had to fire it up of course. :0(
Ip = nothing. No SKEDS tonight...

73, Lou

Thank you Mike, I will.

Before it arrived I was fretting over whether or not I should just lightly clean it, make it operational leavening it as originally built as possible. Now that I see the builders less than wonderful assembly and wiring I will probably break it down restoring each element than reassemble and wire to my satisfaction. No additional parts or circuit changes though...

I suspect many (most?) of the amateur transmitters built in that era, -
and other eras, too, for that matter - were not constructed as carefully
and are not as "pretty" as the photos published in the QST articles or
ads. For many the objective was just to get on the air, and
appearance/attention to detail/aesthetics was not an important
consideration. But for those who value form equally to function, it is
an added source of pride and enjoyment.

Good news !! The first objective has been achieved. The radio collection owned by Musée québécois de la radio has been saved but only for three months. A temporary storage location has been found until August 16, 2014. We now have an additional three months to find a permanent solution for the collection.
****
As you know, the collection is impressive. It contains over 1900 pieces of radio equipment and over three quarters of a million pages of documentation. It is part of our history. We cannot stand by and let this collection end up in the garbage. I have added some photos of the radio collection on my historical site "radiocommunications.ca". Here is the link:
**

From: Michael A. Bittner
Topic: 9624 Message: 9624

Help needed for schematic diagram. Perhaps the incrdible store of knowledge available on this list can be of help with my latest swap meet find.

It is a used set of front-end coils for a Teleradio 4-band receiver. They must have come from a fairly high-end radio as there are two 4-band, shielded RF coils in addition to the matching 4-band, shielded antenna and oscillator coils. Their shiields are 2" squuare by 5" high and stamped 8F80 Ant, 8F81 RFs and 8F82 osc. Preliminary resonance check shows them covering BCB to 15 MHz. I checked Radiomuseum and they show Teleradios with up to 3 bands, but no higher.

I have restored these coils to near original condition and would like to put them to use. Can anyone identify what radio they came from and possibly help with a scematic diagram?

Mike-W6MAB

9625. Wire for RF Osc Coils

Yahoo group: AWAGroup (2014 — 2016)

Good afternoon all,
I am looking for some #20 DSC & #18 DSC wire. The supplier only
lists DCC and magnet wire. The turns spacings for the 3 coils are:
close wound, dia of wire and twice wire dia. The coil dia is 1.5 inches.
I know they specified DSC wire for a reason....but my question is
will it make any real difference if I use DCC or magnet wire...same
wire sizes, tpi.....just diff. insulation. The coils are for an rf osc.
Tnx...73 de Bill K4JYS

How critical is the type, size, etc. of the wire for coils? I wind coils with whatever I find in my junk box and then coat them with home made Q dope and they seem to work just fine. Is it practical to be so precise about something the can be skewed by stray capacitance or other unknown? The coil can be wound on a small form with a powdered iron core and adjusted to the exact inductance if necessary. On the other hand, if you're looking for the Higgs Boson.....

Hi Bill,

Practically I don't think it will make any noticeable difference if you use enameled or DCC wire to replace the specified DSC wire.

Here are the considerations as I see them:

1. The interwinding capacitance may be different because of the differing dielectric constants of the insulation materials.
2. The Q of the windings may be different due to differing loss factors in the insulation materials.

The effects will be greatest for the close-wound case, and less so for spaced windings - the larger the turn-to-turn spacing the smaller the difference.

I would go with the DCC over enameled magnet wire for aesthetic reasons.

Hi Jim,

I've been meaning to get back to you on this. I'd like to try your procedure out. I have three rigs with xtal phasing (HRO-W, NC-101X, HQ-120X).

The reason for me taking so long to reply is that I've been trying to figure out whether the QST method is 'wrong' or whether my phasing controls are not properly set up. None of my manuals for these rigs are very clear on the calibration process, and the manual descriptions of how they are supposed to work do not match what I observe.

Steve, KK7UV

Subject: [AWA Group] Crystal Filter adjustment procedures

Folks,

I'm involved in a discussion with the Editor and the Senior Assistant Technical Editor of QST and the author about the article published in the April issue of QST, "Crystal Phasing." I've tried the procedure outlined in the article under "Adjusting the Crystal Resonator Filter," and I've not been able to make it work. I've written up an alternate procedure that I believe will work on any receiver of any make that uses a vintage crystal filter.

I need some volunteers to try both procedures. It is entirely possible that I'm mistaken about the QST procedure, and I'd like to know that if I am. I'd also like to know if my procedure works, and I'd appreciate suggestions about how to make it better. It may eventually show up as a Technical Note in QST if the folks there can be convinced that there is a problem with the one that they published.

If you have a receiver with a vintage crystal filter, any make, and you would be willing to spend a little time trying out these two procedures, please let me know. I will respond with an email containing a copy of the QST article and a copy of my proposed procedure. I will report your results, whatever they may be, to the folks at QST.

Thanks very much,

Jim Hanlon, W8KGI

This may be off topic, but I just inventoried a several hundred IC chips I found in my junk box. Most of them had regular industry numbers on them but many had 8 digit numbers like, 20485132 or 14473233 on them. I used to have a cross reference, listing IC's with these kind of numbers on them, but I can't find it anywhere. I can't find anything on the net either. Does anyone know of such a list that can be downloaded?

Louis,

I have some pieces of old Square hookup wire salvaged from an antique homebrew radio. The longest piece is 9.5 inches long, not counting bent portions. I thought this might be of interest to you for your REL transmitter project. It's yours for the cost of postage. If interested, let me know with a shipping address and I will figure the shipping cost. If not interested, no problem.

Ron, IMHO, the TNT is a good way to go. My first '20s rig was the TNT
from Dec 1929 QST. I used a '01A...it's an inexpensive way to start. And
its one tuff tube. I'm using a 1924 version in a 160m Meissner osc. So far I
have run it at as much as 300VDC at 22-25 ma. Hope to use it in the next BK.

If you need specific parts, please let us know...many of us have considerable
junk boxes or at least know good sources. Oh and congrats on retirement...
ain't it great.

Ron, tubes prior to 1930 are acceptable.
The BK uses 160, 80 & 40. I think 80 has the most
activity, but restricted to night time use, due to prop.
If you can, you might consider a tank coil for 40 so
you can have a little day-light activity....also good for
some night time dx.

By all means Ron, please consider 40m as well, which sees more and more activity in the '29 Party every year....ever since we moved away from digital hell around 7040. If you are feeling REALLY ambitious, there is also a growing group of 160m stations during the Party as well....but 80m for sure.

Hi Lou, & all,

You asked about first-time startup experiences with my 'bandswitched' TNT... It worked right from the start, much to my surprise. There was no smoke, although I did have an extinguisher at the ready, just in case! As for coupling to the antenna (in my case, a G5RV), the original plans called for a series capacitor (fixed) to be used, but I used inductive coupling instead--as suggested to me by Bruce Kelley. I use a one-turn loop of Romex insulated wire that fits snugly between the turns of the tank coil and simply arrange it for the best combination of output power and tone quality. I seem to get the best results with it placed about 80% of the way toward the end of the tank coil. I connect the twisted pair from the loop leads to a short piece of coax that goes to my tuner, which I pre-set using RF from my modern rig, as there is not enough power from the TNT to get a useful reading.

I was pleased to manage a 3rd place finish in the 2nd call area for the recent Bruce Kelley event using this little 'peanut whistle' rig. Not bad for 1 watt on a breadboard! I hope to work many of you in future events, or just for a casual QSO sometime on 40 or 80m.

No, you're not a nuisance.

Now, Lou, for example, is a nuisance (just kidding, Lou :-))

Back to your question - the 245, or '45, is a FB 1929 tube and I used a pair in a PP-TNT for many, many years in the 1929 QSO Party until I made a fatal mistake and killed the pair. Now I'm using a pair of '71As.

80M is still the highest participation, but there's more activity on 40M each year, as Steve VE7SL has said. Wind coils for both bands, as well and 160M if you have the antenna for it.

I see you've gotten good responses from the gang. Yes the 45 is great for a 1929 transmitter. The rules say something to the effect that any tube that was available in 1929 or earlier can be used, no matter if it was made in 1930 or 1940. Popular tubes include the 27, 10, 210, 45, 71A, 211 (cranked way back).

Highest participation by far is 80m. 40 meter participation has been increasing significantly although I though 40m propagation was very poor this past December. The year before, 40m was good for the Sunday morning and afternoon time while 80m was dead.

160m activity is low but slowly increasing.

Good luck with your TNT. The TNT, TGTP, Hartley, and Colpitts are all popular self excited transmitters used in the 29. I think the Hartley is the most popular followed by the TNT, followed by the TGTP, followed by the Colpitts. I might have been the only guy running a Colpitts last December since Eddy VE3CUI wasn't able to make it.

Gentlemen,

I don't make it a habit of selling my gear.But I have a vintage item that is just gathering a lot
of dust in my shack. It is a National HRO Sr. (serial N164). I would prefer to have anyone interested to arrange a pickup, rather then shipping it. If anyone is interested, I will forward an
MS Word document with a lot more detail. No phone calls, just emails please.

Thank you for your kind attention and patience.

CUL, Roger/K1TG

Howdy Dan,
     Please find attached a MS Word document with most of the particulars on the unit. Packing
and shipping would be costly. Pricewise, it's sort of a "best offer." I never know what they are
worth. I paid $450 for it about 10 years ago.

GM,

First of all, I need one foot of "new" #12 ga. square Buss wire. All expenses paid.

Anyone here do simple lathe work? I need a shaft extender using this 1/2" hard rubber rod. The shaft is 3/16" dia. Will require 4 6-32 threaded set screw holes.
Cash paid.

9680. REL 175 Rig Test Problem...

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-06-13 03:03:26 UTC
From: Louis Vermond
Topic: 9680 Message: 9680
Attachments: 5 described; binary payloads are missing from this source WARC

Hello,

The restoration is all but finished, but I've run into a problem in the testing.

Before I dismantled the rig for restoration I fired it up to learn the Black Art of operating a non-Hull Hartley. It was a struggle, but after I found the correct tank coil taps the rig worked quite well into a load....considering what it is, a minimal circuit transmitter.

The only major change I made while rebuilding was to replace the original #18 square Buss wire with #14 ga. square. ...Purely aesthetics. The Buss routeing and lengths are essentially as with the original. The flexible coil tap leads are only marginally shorter than they were.

The Beginning
The two fixed capacitors are .002 / grid resister is 10K

The Problem

With no loading and the tank coil taps located where they were before disassembly (and the rig working), 80 meter fundamental oscillation is intermittent when keyed on and off. That is, the monitored signal disappears and the Ip jumps from 25 ma. to 80. Continuous keyed oscillation is maintained though if my hand is on the tank capacitor dial!
If I removed my hand, oscillation becomes intermittent once again.

With a load the rig will oscillate as before, that is, as long a my hand is on the dial knob, but stops oscillating when the antenna circuit to tuned to beyond 2 watts output then the monitored signal disappears and Ip jumps to 100ma. At this point though the watt meter is showing 1/2W out to the load. That is, there is oscillation, but who knows at what frequency.

Early on I happened to leave a short test lead in circuit as shown below. With this in place, all oscillation problems disappeared and the rig worked as expected considering etc. etc.

To see what would happen if I shortened the lead length (being longer made no difference in performance) I made up a duplicate lead. With the B+ off (every time) I shortened the wire an inch at a time. At the length you see below the rigs keying was alright, but the signal was sounding "anaemic". Anaemic as in the way a crystal controlled power oscillator transmitter signal sounds as you near the oscillation cut off point when tuning the tank capacitor for maximum output. Sort of gasping its last so to speak... much like Larry's Kelly signals.

The plot thickens

Noticing a bit of signal wobbling I removed the millimetre thinking that might be the cause. The rig keyed readily enough, but the max. output dropped from 7W to 5W at which

point the fundamental oscillation cut out. Please see below photo.

Does anyone know or have ideas as to why this is happening? Are there any suggestions as to how I can make the rig behave without that bit wire? I would be happy to perform any required tests.

73, Lou

Try putting .002 bypass condensers from the filament terminals to ground and B+ to ground.

Also try connecting the tuning condenser leads to the same points as the other leads connected to each end of the coil.

Hi, Lou,

First off, Jon's suggestions are good ones. Try one at a time. Also, the location of the feedback coil is critical. I don't think the change from #18 to #14 buss wire is the culprit, but, then again, I have a real hard time explaining the effect of clip lead. If it was VHF or even upper HF, that would be one thing. But this is 80M. All kind of wierd things can be observed when the oscillator is "on the edge."

I have found my Hartley to be very finicky on 40M with low-mu tubes like the '45, '71A, and '10 - can't load very heavily at all before oscillation quits. As I have mentioned before, it is much better behaved with a 841, which has a mu of 30. That would seem to indicate inadequate feedback is responsible.

You didn't mention if you tried different locations for the ground tap after the rebuild - that's the "knob" for controlling the amount of feedback, and is where I would start.

I think my sigs you are referring to are my 40M ones from the PP TNT. The Hartley oscillates readily on 80M with the 841, the only issue being the tank coil vibrates with keying or Elaine walking upstairs in the kitchen, or (especially) when she comes down the cellar stairs.

I am not sure I understand Lou's description of his problem. Lou – are you saying it oscillates or draws plate current with the key up? According to the schematic that is impossible unless you have some leakage between the filament and the HV supplies. As has been mentioned, bypassing is always a good thing. 73 – Mike

Hi Lou,

Two possibilities come to mind, regarding the strange behavior of your Hartley. The improvement brought about by the addition of a small parasitic capacitance (your wire lead) to the plate circuit, suggests two possibilities, to me.

First, one or possibly both of the fixed caps (grid leak and DC blocking cap, in the shunt fed plate ckt) may be defunct. The internal connection(s) between the multiple layers of the internal sandwich of plates and mica dielectric, may be corroded/broken or otherwise defunct. I would suggest substitution, with known good modern units, rather than attempting to test.

Second, the RF choke may be operating too close to its series resonant frequency. The addition of the
parasitic capacitance may be shifting the choke resonance in a favorable direction, which causes an improvement in operating conditions. You could eliminate this possibility by simply disconnecting the B+ lead, and adding a pi wound 1 or 2.5 mh RFC in series with the B+ lead (but on the "downsteam" end of any added bypass cap).

one at a time.
Also, the location of the feedback coil is critical. I
don't think
the change from #18 to #14 buss wire is the culprit,
but, then
again, I have a real hard time explaining the effect
of clip lead.
If it was VHF or even upper HF, that would be one
thing. But this
is 80M. All kind of wierd things can be observed when
the
oscillator is "on the edge."

I have found my Hartley to be very finicky on 40M with
low-mu
tubes like the '45, '71A, and '10 -
can't load very heavily at all

before oscillation quits. As I have mentioned before, it is much
better behaved with a 841, which has a mu of 30. That would seem
to indicate inadequate feedback is responsible.

You didn't mention if you tried different locations for the ground
tap after the rebuild - that's the "knob" for controlling the
amount of feedback, and is where I would start.

I think my sigs you are referring to are my 40M ones from the PP
TNT. The Hartley oscillates readily on 80M with the 841, the only
issue being the tank coil vibrates with keying or Elaine walking
upstairs in the kitchen, or (especially) when she comes down the
cellar stairs.

Subject:
[AWA Group] REL 175 Rig Test Problem...

Hello,

The restoration is all but finished, but I've run into a problem in the testing.

Before I dismantled the rig for restoration I fired it up to learn the Black Art of operating a non-Hull Hartley. It was a struggle, but after I found the correct tank coil taps the rig worked quite well into a load....considering what it is, a minimal circuit transmitter.

The only major change I made while rebuilding was to replace the original #18 square Buss wire with #14 ga. square. ...Purely aesthetics. The Buss routeing and lengths are essentially as with the original. The flexible coil tap leads are only marginally shorter than they were.

The Beginning
The two fixed capacitors are .002 / grid resister is 10K

The Problem

With no loading and the tank coil taps located where they were before disassembly (and the rig working), 80 meter fundamental oscillation is intermittent when keyed on and off. That is, the monitored signal disappears and the Ip jumps from 25 ma. to 80. Continuous keyed oscillation is maintained though if my hand is on the tank capacitor dial!

If I removed my hand, oscillation becomes intermittent once again.

With a load the rig will oscillate as before, that is, as long a my hand is on the dial knob, but stops oscillating when the antenna circuit to tuned to beyond 2 watts output then the monitored signal disappears and Ip jumps to 100ma. At this point though the watt meter is showing 1/2W out to the load. That is, there is oscillation, but who knows at what frequency.

Early on I happened to leave

a short test lead in circuit as shown below.

With this in place, all oscillation problems disappeared and the rig worked as expected considering etc. etc.

To see what would happen if I shortened the lead length (being longer made no difference in performance) I made up a duplicate lead. With the B+ off (every time) I shortened the wire an inch at a time. At the length you see below the rigs keying was alright, but the signal was sounding "anaemic". Anaemic as in the way a crystal controlled power oscillator transmitter signal sounds as you near the oscillation cut off point when tuning the tank capacitor for maximum output. Sort of gasping its last so to speak... much like Larry's Kelly signals.

The plot thickens

Noticing a bit of signal wobbling I removed the millimetre thinking that might be the cause. The rig keyed readily enough, but the max. output dropped from 7W to 5W at which point the fundamental oscillation cut out. Please see below photo.

Does anyone know or
have ideas as to why
this is happening? Are there any
suggestions
as to how I can make the rig
behave without
that bit wire? I would
be happy to perform
any required tests.

73, Lou

WU2D, Your suggesting and insights are appreciated as all were. Thank you.

G E,

This afternoon I spent an hour and a half preparing my reply to your comments and suggestions of yesterday. An hour ago a new "test" occurred to me that I thought might be worth trying and then relaying here. Because the results of that test may make everything preceding it redundant I will put my earlier reply on hold until I receive your reaction to what is to follow.

These are the tap positions I have been working with. Note particularly the two just under the centre glass bar coil support. Again, they are from the tuning condenser.

Note that the left tuning capacitor tap has been moved one turn to the right.

Here, the right capacitor tap has been moved one turn to the left.

With either one of these two tap changes the need for the RFC-test lead "fix" is not required. That is, the rig oscillates merrily away without it.

You will have noticed just above the "dead" winding between the tank and antenna coil. With the dreaded "dead-end effect" in mind I compared the signals of the two changes. Differences there were, but too tired to tell that story this evening.

Comments please.

73 & GN, Lou

Lou,
     Good on you. This sounds related to some of the early attempts and band-switching and the
problems it incurred.

Roger.

FLASH!

USCG WILL PARTICIPATE IN NIGHT OF NIGHTS!
NEW USCG STATION ON THE AIR!
KPH, KFS, KSM, WLO AND KLB WILL BE ON THE AIR!

Event Date: 12 July 2014 Pacific Daylight Time
First Transmission form MRHS Stations: 5:01pm Pacific Daylight Time 12 July, 0001Z 13 July 2014

> Historic coast stations KPH, KFS, KSM, WLO AND KLB will return to the air

> RCA "H Set" Transmitter 298 will be on the air

> 1942 Press Wireless PW15 transmitter will be on the air

> USCG Coast Stations NMC, NMQ and NMW will be on the air

> K6KPH will be listening for calls and signal reports

> Join us in person or on the air!

But wait, there's more:
> Marconi author Calvin Trowbridge Jr. book talk and reception

> Fantastic exhibit at Bolinas Museum for 100th anniversary of Marconi operations

> Listen to "An Ode to Morse Code", the story of Night of Nights

> MF antenna filter saga

> Preserving the RCA BL298H set transmitter with heat

Clearly we have a lot to cover in this issue. But before we dive in we'd like to solicit your support for our activities like Night of Nights and the ongoing maintenance and repair of the transmit and receive stations and their associated antenna fields. Any donation you can make will be very deeply appreciated and will go directly to support our efforts. Just click on the button below.

Thanks!

Night of Nights 2014!

Morse code...

It's just beeps in the air. Yet on 12 July 1999 some very tough looking grizzled old radio pioneers had tears in their eyes as the last commercial Morse code radiogram was sent. It was the end of an era. And as the last beeps faded away into the static they witnessed the end of the career to which they had devoted their lives.

These men - and some women - had stood watch over the airwaves on shore and at sea. Theirs was mostly the business of maritime commerce. But when their ship was in peril they were called upon to send the most electrifying three letters in radio, S O S , knowing that all their fellow radio operators would press their earphones close to get every scrap of information and bring aid to their stricken ship.

Once, our coasts were dotted with great Morse code radio stations, all communicating with ships at sea. They're all gone now... all except one, the one they called the Wireless Giant of the Pacific, located at Point Reyes.

On that sad day in 1999 another event took place. The Maritime Radio Historical Society (MRHS) was formed. We made it our life's work to honor the men and women of wireless by restoring that wireless giant. One year and one minute later the giant's voice once again spanned the oceas as we picked up the thread and kept the faith with our colleagues of the air.

Every year since, in an event that became known as the Night of Nights, Morse code station KPH has returned to the air, joined by KFS and the station of the MRHS, KSM.

This year our friends and colleagues at USCG station NMC have labored mightily to bring that storied call sign back to life on Morse code for the evening along with NMQ in Cambria, CA..

And, for the first time on Night of Nights, station NMW in Astoria, OR will be on the air as well.

Stations WLO and KLB will join us again as hey have in years past.

This is a global and local event. Hundreds of listeners around the world will be waiting with their earphones on, waiting for the signals of the great station to once again arc

over the dome of the Earth to their receivers.

You can be with us in person!

Dozens of people will join us at the RCA receiving station in the Point Reyes National Seashore to watch as the signals are transmitted by hand using vintage telegraph keys.

A guest operating position will be available so bring your key and 'phones or use ours and operate K6KPH. No license required! So if you're an ex-commercial op who never became a ham here's your chance to sling some Morse again. Or if you hold a current commercial radiotelegraph ticket you can operate KPH, KFS and/or KSM and have your license endorse to that effect.

Chief Operator Richard Dillman at Position 1

Date: Friday 12 July 2014 Pacific Daylight Time

Location: RCA receiving station, 17400 Sir Francis Drake Blvd., Point Reyes National Seashore

Click HERE for a map of the location from Google Maps

Time: Doors open at 3:00pm pdt, first transmission 5:01pm pdt (0001gmt 13 July)

Refreshments: Served

Photographs: Encouraged

Tours: Given

None of this would have been possible without the trust and vision of the Point Reyes National Seashore . The only reason these facilities were spared the bulldozer that visited all the others is that they are on park land. And the only reason they have been restored to operation is that the PRNS staff understood their importance and trusted the MRHS to restore them to life.
  We will send last minute changes and signal reports by Twitter. You can join Twitter free at:

https://www.twitter.com

and follow us at @Radiomarine

MRHS Stations

Sixteen transmitters will be on the air from the MRHS transmitter site in Bolinas. That doesn't include transmitters held in ready reserve in case of failure. Members of the crack MRHS Transmitter Department and the H Set Team will be on hand to assure that all goes well.

The receive site may be contacted by phone on 415-669-9646

USCG Stations

NOTICE!

This may very well be the last time ever that USCG stations can be heard on the air using A1A (Morse) emission. As new equipment is installed the hardware and wiring for Morse has been progressively removed. And the personnel who knowledgeable in the art retire or are reassigned. So be sure to listen for these stations.

Many USCG personnel at all levels are responsible for bringing these stations back on the air for Night of Nights 2104. We want to particularly thank ET1 Mike Leska for taking the lead for this year's project.

NMC/NMQ verification card from Night of Nights 2014

Was your father, uncle or grand dad a commercial op or amateur operator? Would you like to send a commemorative message in their honor over KPH, KFS and KSM? We have sent several of these messages in past events and they were all very moving. If you would like us to send such a message this year please send it to us no later than Wednesday 9 July pdt so we can be sure to include it. Sent it to info@...

> Marconi author Calvin Trowbridge Jr. Book Talk and Reception

Make it full weekend of radio with this event the day after Night of Nights

Date: Sunday, July 13
Time: 2 pm to 5 pm
Location: Red Barn Classroom at Bear Valley.   Directions.
Phone: 415-464-5125

Description: Meet the author of Marconi: Father of Wireless, Grandfather of Radio, Great-Grandfather of the Cell Phone, The Story of the Race to Control Long-Distance Wireless. He will speak about Marconi's empire building, the competition and patent wars, and the fast pace of invention and technology change as the potential for radio became understood in the early 20th century. Books will be available, enjoy a chat with the author and complimentary refreshments.

> Fantastic exhibit at Bolinas Museum for 100th anniversary of Marconi operations

The Marconi trans-Pacific stations in West Marin went into service in February 1914 with a transmit site in Bolinas (still in use today) and a receive site at Marshall.

Carola DeRooy of the Point Reyes National Seashore and Jennifer Gately of the Bolinas Museum combined efforts with many other to produce a truly wonderful exhibit at the Bolinas Museum commemorating this event.

Marconi & Sarnoff at Rocky Point, tube display including water cooled tube, submarine spark transmitter on display

The exhibit includes a great display of power tubes, the submarine spark transmitter donated to the MRHS as described in Newsletter No. 41 , a great assortment of keys and bugs, an IP501A receiver and much more.

The museum is located at 48 Wharf Road in Bolinas. The hours are Friday 1:00 - 5:00, Saturday 12:00 - 5:00, Sunday 12:00 - 5:00

Richard Dillman, Carola DeRooy and Denice Stoops at exhibit opening

> "An Ode to Morse Code", the story of Night of Nights

Julie Caine is a producer at public radio station KALW in San Francisco. In 2013 she produced a wonderful radio program about Morse code and Night of Nights.

Click HERE to listen to "An Ode to Morse Code".

> MF antenna filter saga

KSM uses a Marconi T antenna for MF reception. This is a great antenna - almost too great as it pulls in all sorts of broadcast signals. Plus it feeds a house made preamplifier that can be easily be driven non-linear by strong signals. To prevent problems there is a selectable frequency filter at the base of the antenna that's remote controlled from Position 1. The filter and its housing served well but eventually the salt air took its toll. That's where Bill Ruck of MRHS Maintenance stepped in. He rebuilt both the filter and the case. Let's listen now as we hear Bill say...

KPH's MW receive antenna at RS has for a long time been a "Marconi T" antenna.

The problem with maritime band MW reception is that just above the maritime band is the AM Broadcast band with many high power (mostly 5 kW and a few 50 kW) stations nearby. A good maritime MW receive antenna is also a good broadcast MW receive antenna.

The KPH home-built MW multicouplers overload from broadcast stations so a filter was added to the receive system to allow good maritime reception without overloading.

The filter assembly had five fixed frequency series L - C filters plus a direct selection connected via a 6 pole single throw coaxial relay. This relay is commonly used at RS for receiver input selection from the SW multicouplers.

The assembly was housed in a galvanized steel box on the pole at the feed of the "Marconi T" antenna in what used to be the "C" antenna field.

The first experience with the filter was when the Operations Department complained that one of the filters did not work.

A trip to the antenna and filter was in order. I found the box, pried the lid off, and removed the relay / filter assembly. Back at RS it was easy to spot the bad filter because there were two wires in mid-air and no capacitor. Likely a nearby lightning strike had blown apart the small capacitor. An identical replacement was found in the shop, installed, and the filter frequencies adjusted with a spectrum analyzer and tracking generator.

Re-installing the filter I added single pole Molex pins and sockets so that the relay / filter assembly could be removed without field soldering. At that time it was readily apparent that the galvanizing had worn off and the bottom of the box was mostly rust.

This worked for a couple of years until again the Operations Department complained that one of the frequencies did not work. In the field one could see that about half of the bottom of the galvanized steel filter box was missing. The relay / filter assembly was removed and returned to the shop.

Filter box and filter as found

This time the cause was sufficient rust on the relay clappers to restrict the motion sufficiently so that the contacts were never pushed together. The rust was filed off of the clappers, the contacts were good, and the relay / filter assembly was returned to the box. An attempt to seal the box with 2" wide 10 mil black tape was made, although it was hard to get the tape to stick to the box.

A couple of months later again the Operations Department reported one of the frequencies did not work. In the field the tape had fallen off, more of the bottom of the box had rusted out, and rust and corrosion was evident inside on the relay / filter assembly.

Original filter assembly, rear

The assembly was returned to the shop. The rust on the relay clappers was filed off again and this time a coat of clear nail polish was applied to slow down the rust. Once the polish had dried the assembly was returned and all filters worked.

It was clear that this design was at the end of its life. Many discussions were held to determine the course of replacement. One idea was to replace the switched single frequency filters with a single fixed low pass filter; perhaps with a second notch filter to remove the high power broadcast stations near the bottom of the dial.

The Operations Department wanted to keep the historical fabric intact even though there are clear advantages to the fixed low pass filter.

Ye Olde Junque Boxe was scrounged for parts. I found six 24 VDC single pole NO reed relays. Reed relays have the advantage that the contacts are totally sealed in a glass tube. They can not handle much current, but they would be more than acceptable for a receive application.

We also had saved parts from the KMI antennas when they were cut down and found from that salvage a good fiberglass water-tight box with feed insulators in the shop.

The plan was to fabricate a whole new filter assembly and replace the rusted out box and rusted and corroded relay / filter assembly.

Two enhancements were added. The first was a static drain choke. The "Marconi T" antenna is either floating when no relay is selected or DC isolated when a filter is selected since the filter is a series L - C filter. Surplus Sales of Nebraska had an appropriate coil that could be used as a static drain choke.

The second enhancement was a spark gap external to the filter box. A suitable gap was fabricated from ¼-20 brass all-thread mounted to the antenna and ground insulators.

Five new adjustable inductors were also purchased from Surplus Sales of Nebraska for the filters.

The relays and filters were fabricated on an aluminum plate that would mount internally in the fiberglass box. Since the reed relays are sealed inside of the coil it is impossible to observe them LED status indicators were added showing which relay had +24 VDC.

The relay coil DC connections on the existing filter assembly were with the standard RS style S-308 CCT Jones plug but I wanted a connection that did not need field soldering. An 8-140 barrier strip was used so that crimp lugs could be used to terminate the control cable.

New filter assembly in new enclosure

The relay assembly had a binding post input terminal and a BNC output connector. A short BNC to N female chassis jack RG-58C/U coax cable was used to connect the filter to the outside world.

The control cable got a weather tight strain relief.

Some discussion was made over how waterproof the assembly could be. The box itself is well sealed but the two insulators (antenna and ground) could leak. The insulators were sealed with a drop of silicone RTV inside the insulator and the rubber washer was liberally coated with silicone grease but these seals may not be perfect. Finally we decided to use a vent so that if water did get in the box would not fill up with water but drip out. Hoffman makes water-tight electrical boxes and they make an appropriate vent accessory and one was purchased. A ½" threaded hole was made for the vent.

The next design issue was how to mount the new filter box. The box is designed to mount to a flat bulkhead but in the antenna field it has to mount to a round wood pole. After some thought a simple mounting bracket could be fabricated from strut. However, since the location is close to the ocean, standard zinc-plated steel strut would start to rust the

day it was installed. Galvanized steel strut is available but the cut ends would rust, even after a coat of zinc-rich "cold galvanize" paint. The decision was to use stainless steel strut. I was staggered to find out how expensive this material is but it will last forever. All of the hardware used for this project was stainless steel.

A template was cut matching the box dimensions and mounting holes. The stainless steel strut was cut to length and drilled appropriately. The mounting bracket assembly was put together and checked for dimensions.

All was tested and ready for installation.

Saturday November 9, 2013, the installation work commenced. Operations were possible by bypassing the filters although with the antenna directly connected to the coax there was a lot of IM and noise on the maritime frequencies. The old box was removed with no issues (it basically fell apart) and the new mounting bracket attached to the wood pole with ¼" stainless steel lag screws. The filter assembly bolted to the holes in the bracket. The antenna connection was made with a new lug on the down lead. The filter ground connection and mounting bracket ground connection were tied to the existing ground lead on the pole. The control cable was cut to length, crimp lugs installed, and landed on the barrier strip.

New filter mounted on pole

Then the "Welcome to KPH" moments started. Checking with Position 1 selecting various filters the relays did not work. Turns out after some head scratching I remembered that while every other relay at RS uses the black wire for DC minus the filter relay used the red wire for DC minus. In the process of sorting this out the +24 VDC got shorted to the DC minus and the fuse for that switch blew. It took a little time for Chief Operator Dillman to find the blown fuse and replace it. Now 5 of the 6 relays worked. We will return to the bad relay later.

Good engineering practice is to use Type N RF connectors but the existing coax cable had a UHF male connector so an adapter was used at the output connector. But Chief Operator Dillman reported no signals at Position 1. More investigation revealed that the box thickness was sufficient to keep the N male connector from mating properly with the N female chassis bulkhead connector. A short BNC cable was used to bridge the cap between the filter output BNC and a BNC-UHF adapter to the existing coax. Now Position 1 could hear signals. The cable and connectors were taped up to make them weather-tight as an "OK temp" solution.

The next weekend I investigated the one relay that was not working. At the relay box I could not measure any voltage on that control wire but if I lifted that lead I could measure a volt or so into my VOM. Back at Position 1 I could measure a full +24 VDC. Likely conclusion is that this wire in the control cable is broken at one point. Fortunately the control cable is a 9-conductor #18 AWG cable and we only need 7 wires. The plan is to switch out the bad wire with the spare conductor. This is easy at the filter box but the other end of the control cable is soldered to a xmas tree block which makes it hard to rewire.

On another trip a barrier strip was added at the multicoupler and relay box and the control cable was cut and terminated at the barrier strip.

By this time it was winter and the MF Marconi T feed is located at a low point in the field. It fills with water and lacking a small boat or hip waders we had to wait until it

dried out. Late rains kept the lake filled but when it dried out a trip was made to swap the wires at both the multicoupler terminal strip and filter terminal strip. The "blue" wire was swapped with the spare "orange" wire and that filter position works now.

Completed assembly

Chief Operator Dillman also reported that the 500 kc filter was not operating. When checked in the field it was working. Measuring the voltage at all six positions revealed that at five of the relays the voltage was about ½ volt higher than at the 500 kc position. At this time we suspect that the "white" wire for the 500 kc relay was going bad. This is a concern because the control cable has nine conductors. Seven are necessary. The "blue" wire is already known bad which leaves eight conductors. The "black" wire is used as a source of +24 volts that is not necessary so the "white" wire can be swapped with that wire. That leaves us with a known failing control cable and no spare wires.

We're now looking for a donation of about 500 feet of at least seven conductor #18 AWG wire suitable for outside use, something known as Out Side Plant (OSP) cable in the telephone world.

Finally we need to come up with a solid mechanical coaxial connector at the filter box. The plan is to fabricate a spacer on the outside of the box to mount a plate with the N bulkhead connector. This will allow full engagement of the N Male cable connector.

The Operations Department is prepared to stipulate that Bill Ruck is indeed a God.

> Preserving the RCA BL298H H-Set Transmitter With Heat

When we began our project the salt atmosphere in the transmitter gallery was virtually the same as that outside. The "modern" (1990 vintage) Henry transmitters had been abandoned for two years. There was standing water inside them from condensation. The classic transmitters from the 1950s had been abandoned for ten years. The controls were frozen and the doors couldn't be opened. When we did open them we find staggering amounts of rust and corrosion.

When you're running transmitters H24 as RCA did the heat keeps them moisture free. We now run the Henry transmitters only once a week, the classic transmitters even less frequently. So when the H Set Team completed their stupendous restoration of 298H they wanted to make surethe classic gem did not once again become a victim of salt air and moisture. Here's the story of how they did it, told by Greg Farrell of the H Set Team:

Superintendent Cicely Muldoon pits restored T298H on the air for Night of Nights 2013
Many of you are already familiar with the work the venerable H-set team did to restore the RCA 20 KW SSB T3 "H-set" transmitter and get it back on the air. It was a huge team effort, with countless trips to Bolinas (BL) and thousands of hours of volunteer time spent working on it, over a 3 year period. It's dedication occurred on July 12, 2013. What I will be covering in this article, is the design and implementation of a heating system, to help preserve the transmitter between operating cycles, which could be days, weeks, months, by keeping the interior hardware above dew point.
We were very conscious of the fact that the marine climate at Bolinas is tough on transmitters. After 30 years of service and 20 years of sitting idle, the salts in the air that had accumulated and precipitated where electric and magnetic fields were strongest inside while it was in operation, had turned much of the exposed metal,wiring, hardware and electronic components into corroded relics. With all the effort put into the restoration,

how could we ensure that history wouldn't repeat itself again, either in the next 10 years or next 1000 years? The work we had done was to restore and preserve a National Treasure of the Wireless Communication Age. We sure as heck didn't want to see it turning into a corroded hulk again!

The humidity on the coast at Bolinas runs high most of the year, between 80%-99%, with a dew point that runs in the mid 50's most of the time. Dew point is defined in Wikipedia, "as the temperature at which the water vapor in air at constant barometric pressure condenses into liquid water at the same rate at which it evaporates. At temperatures below the dew point, water will leave the air."

The prevailing on-shore winds off the Pacific Ocean, move tons of NaCl molecules over the land, and anything that is exposed or that moves air will get exposed continually with molecular salt. We knew we needed heat to keep the transmitter above the dew point, especially during the winter months, while it was sitting idle between operations. The RCA transmitter building 2A is not heated, and gets quite cold inside at times.

We knew we needed to get heat inside the transmitter cabinet, but in particular, heat into the sensitive RF Power Amp/Modulator Assembly. With limited funds, we needed to come up with a solution that was not only inexpensive, practical and durable, but also one with no moving parts, or parts that could easily fail due to fatigue, age or corrosion.

Several options were investigated, including high-grade commercial/industrial heaters, strip heaters, cabin heaters etc. Finding a suitable thermostat was another challenge. Most thermostats commercially available are not designed to operate indefinitely in a harsh marine environment.

On the way home one day from Bolinas, riding with Bob Dildine and Larry Nutting, I asked the question, "What if we used power resistors?" They have no moving parts. Their resistance and power (heat) output is rated specifically. All they need is electricity. Sealed, they will produce a known value of power in watts in perpetuity as long as AC current is available to them.

The thermostats selected had to be sealed, durable and able to survive the salty air. After investigating possible sources, I settled on using one made by a company named SENASYS, model 2570L334 (L-1671) . Sealed, it is designed for use in extreme environments. This particular model closed (power on) at 60 degrees F (15.5 C) and opened (power off) at 70 degrees F (21.1 C). And they were cheap! Price was $9.75 each, so I ordered two with one for back-up.

For the resistors, we selected a DALE RH-250 250W 120 OHM 5% power resistor, readily available and cheap ($7 each on eBay). They produce a nice even predictable level of heat when mounted to 3/8" aluminum plate. We decided to mount them in series using thermal compound, to operate at approximately 55-60 watts at 1/2 amp for nice, gentle continuous operation.

DALE 120 Ohm resistor   Larry Nutting, assisted me in the overall design, locating and selecting a suitable aluminum mounting plate at a local salvage yard, drilling and tapping holes, along with testing and validation prior to finalizing the design and installation. The plate had to fit the bottom of the PA assembly exactly, and its mounting holes had to align where screw holes already existed to attach the large PA bottom cover. One of guiding rules during the restoration project was to avoid unnecessary cutting or hole drilling, to keep the transmitter as original as possible when it ceased operations in the early 1990's.

The thermostat was mounted to the outside of the PA assembly against one of the side covers. Fleece covers were used to cover the top cabinet vents, so when the transmitter is offline the vents are covered to reduce heat loss out the cabinet itself (it has plenty enough openings already without the vents being left open!).

Testing was done both on the bench and inside the transmitter day.

During bench testing, the plate would warm to a nice 130-135 deg F and pull a steady 500 ma. @ 120 VAC. Field testing with the plate assembly mounted inside H-Set # 355, measuring ambient temperature after four hours the probe inside the PA Assembly read 77 deg F (25 C) but this was in May 2012.

Early bench testing of resistors   Installation in #298 took place September 15, 2012 during a very difficult time for me, as my father had come down with terminal cancer and passed a month later.

Further temperature measurements were taken during November 2012: inside PA assembly 67 F (19.4 C), inside main cabinet 61 F (16 C) ambient. On a very cold day in February 2013 (we'd had a long cold spell all throughout January into February), I measured transmitter gallery ambient at 51 F (10.5 C), inside main cabinet 52 F (11.1 C), inside PA unit 57 F (13.8 C) ambient with the metal anywhere from 52-89 F depending on where you took the reading with the Raytek Raynger ST2 "gun". Dew point was at 51 F (10.5 C). The heater was doing its job!

Since there is no power on to the transmitter "after hours", external 115VAC power was brought in initially with an extension cord, due to time constraints, with a later project to upgrade and install a direct line up through the floor in conduit to the transmitter. That project is currently underway. In fact, the H-set heater design has proved so successful, that MRHS has decided to direct wire all the RCA "L" and "K" set transmitters in the gallery and install Dale resistor heaters. At some future time, we may run heaters into some of the unrestored RCA H-sets.

Heaters mounted to bottom of PA assembly   In addition to the PA Assembly Dale power resistor heaters, two 60 watt infrared reptile heaters (they emit no visible light) were installed to add supplemental constant heat inside the open cavern of the transmitter cabinet. A temporary neon lamp is employed to indicate when the PA heater is on or off as governed by the SENASYS thermostat control. Longer-term, a front panel neon indicator light will be utilized to indicate external 115VAC power is on into the cabinet, in addition to the one employed for the PA assembly heater. John Felton helped design and install a similar power resistor heater solution, to keep the downstairs PA plate transformer warm and dry. Unwanted moisture and salts are considered evil things for HV plate transformers.

The PA assembly heater has been in use since September 2012 with no major issues. BL298H stays toasty warm and dry inside even on the coldest, dampest days at BL. It is a treat to open the cabinet door when I am out there and feel the warmth inside, and know that this transmitter might just be operable 500 years from now.

Gentlemen,

I am in need of the alignment procedure for an RME LF-90. It is a rather rare up-converter for early RME receivers.

I have combed the net looking for this information but all I have succeeded in finding is a 2-page blurb from an old Rider's manual. I'm not even sure that RME ever provided this information.

I would be eternally grateful to anyone who might have an original manual that they would copy and/or any data on alignment procedures.

Thank you for your time and effort.

CUL, Roger/K1TG

Hi Mike,
     Then I have to wonder why the RME-69 and DB-20 manuals both have a replete set of alignment
instructions (?).

     Out there in the "great somewhere" are instructions for the LF-90. The US Navy would never allow
a unit to exist without them.

Roger.

Hi,
     Yes, it does but calibration and sensitivity are not too hot. I'm not sure this would be the best
thing to start off with for 600 meters. There can't be too many of these left.

Roger.

Yes! It made restoring the front panel on my RME-69 a cinch.

Any REAL operator knows instinctively the function of each control (or,
at least, can figure it out in short order. ;-))

I ran across RME founder E. G. Shalkhauser at the Dayton Hamvention one year, and I bugged him about the lack of labels on my RME-69 panel and on the lack of alignment instructions in the manual. He was a pretty salty old cuss. He did indeed tell me that I was supposed to know what the knobs were for and that I shouldn't need labels, and also that I ought to know how to align a receiver without instructions and that if I didn't know I shouldn't be messing around with his radio!

Howdy Jim,
     You're the second response I received mentioning the lack of labels on the many knobs on the
RME-69.

     I might mention here that RME did produce service manuals with detailed alignment data for
the RME-69 and DB-20 pre-amplifier. They were typewritten just like the user's manual.

     From the paucity of answers or ideas I have not received, I would guess it is going to be the
old SWAG method of alignment.

     Thanks for the comments though.

Very interesting transmitter on ebay:

http://www.ebay.com/itm/MASSIVE-ANTIQUE-RADIO-RECEIVER-4-TUBE-5-METER-SETUP-MADE-BY-RADIO-ENGINEER-L-K/321437163311

I am a little doubtful that it is 5 meters. FWIK with tubes of the era to reach that mark the bases had to come off and the "L" was usually a "hairpin" linear design.

None the less I do see a separate oscillator, possibly crystal controlled and potentially operating as a buffer tripler. My hunch is 15 meters...

Very nice vintage work...

Yes it is. I am waiting to bid on it and have been watching it closely. I believe the seller thinks it is a receiver as that is how he has it advertised. As far as the five meters go, I just think he means the actual meters on the front panel and not wavelength. It is hard to tell, but the larger coils may be plug in style as well. The one by the crystal socket is. Also, the schematic shown does not go with this item. 73 – Mike

Subject: [AWA Group] Homebrew 20's transmitter austion

Very interesting transmitter on ebay:

http://www.ebay.com/itm/MASSIVE-ANTIQUE-RADIO-RECEIVER-4-TUBE-5-METER-SETUP-MADE-BY-RADIO-ENGINEER-L-K/321437163311

I am a little doubtful that it is 5 meters. FWIK with tubes of the era to reach that mark the bases had to come off and the "L" was usually a "hairpin" linear design.

None the less I do see a separate oscillator, possibly crystal controlled and potentially operating as a buffer tripler. My hunch is 15 meters...

Very nice vintage work...

Thanks for the reminder Lou, Aero was at the tip of my tongue, but, I just did not remember it. That indeed makes it so they can be interchangeable for different bands. I am sure it will not be a bargain, as there will be a lot of last second bidders. I'll give it a go regardless. 73 – Mike

Yes it is. I am waiting to bid on it and have been watching it closely. I believe the seller thinks it is a receiver as that is how he has it advertised. As far as the five meters go, I just think he means the actual meters on the front panel and not wavelength. It is hard to tell, but the larger coils may be plug in style as well. The one by the crystal socket is. Also, the schematic shown does not go with this item. 73 – Mike

I concur with Mike on "5 meters" referring to the five panel meters, not the wavelength of operation. THis set was clearly built in the 1920s, and 5 meters was SHF back then.

As far as removing the bases of standard receiving tubes to get them to function at VHF - yes, it was done, but it was not always necessary. I reproduced a mid-thirties 2-1/2M transceiver using a single type 76, and it oscillated just fine where it was supposed to with its base intact. I believe it to have been a Frank Jones design, and the base was not removed in the original, either. In fact I successfully moved it up to the 2M band!

Hi Lou,
     It would appear to be a crystal-controlled transmitter. IMHO it probably used a 6L6/6F6/6V6 for a PA bottle.

Roger.

Very interesting transmitter on ebay:

http://www.ebay.com/itm/MASSIVE-ANTIQUE-RADIO-RECEIVER-4-TUBE-5-METER-SETUP-MADE-BY-RADIO-ENGINEER-L-K/321437163311

I am a little doubtful that it is 5 meters. FWIK with tubes of the era to reach that mark the bases had to come off and the "L" was usually a "hairpin" linear design.

None the less I do see a separate oscillator, possibly crystal controlled and potentially operating as a buffer tripler. My hunch is 15 meters...

Very nice vintage work...

Hi Lou,
It would appear to be a crystal-controlled transmitter. IMHO it probably used a 6L6/6F6/6V6 for a PA bottle.

9726. Crescentyne 5 Tube radio

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-07-05 01:23:49 UTC
From: raymcn@...
Topic: 9726 Message: 9726

Hi. I normally do a lot of listening/lurking and enjoy the discussions by the very knowledgeable members here. I work at a stereo/radio shop and a Crescentyne 5 tube radio walked thru the door this week. There was serious discussion to take out the tubes and sell it bit by bit on the auction site. I lobbied to give a chance to sell as a complete setup and have a couple of weeks maybe to see if there may be some interest.

If this is not an acceptable message on this group, please let me know and I will respect the direction I get.

A quick summary of items include the Crescentyne radio (not sure on model) with (4) 01A type tubes and (1) 171 type tube, 2 additional 01A type tubes, A and B battery eliminators, and 1 set Nathaniel Baldwin Type C headphones, The radio does work, we connected power and did receive a local station, I have new respect for the radio listeners of days gone by. The battery eliminators were not tested due to condition.

If there is interest, I can email pictures, or put a couple in the photo section. I can also further describe condition of items as needed. I can be reached at raymcn at gmail period com. Remove the spaces and make 2 conversions as appropriate. Please put the radio name in the subject line.

I have my email set for daily digest, so not able to respond right away to replys here, but will respond as best as I can, and to the group if appropriate. Thanks for the bandwidth, just trying to save some radio history intact.

Thanks,
Ray M

9727. New TX -

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-07-06 16:31:04 UTC
From: Mike Feher
Topic: 9727 Message: 9727

I have been looking into the new transmitter that I purchased off of eBay. Thankfully, it, the monster, arrived safely as it was very well packed. The only thing that was slightly damaged was the output link coil. The tube line up appears to be a 47 for the crystal oscillator, a 45 for the buffer/doubter, and, a pair of 210s in the final. The schematic that came with it, and the set do not completely agree, but they are close. The larger coils are of the Aero type. The schematic shows 7 meters, but, the set only has 6. Just about everything is metered. The thermal galvanometer is for crystal activity, there are AC voltmeters for the tube filaments and DC milliamp meters for plates..

While I have seen some of the beautiful sets built by some of our members on this list, I find it hard to believe that someone in the late 20's would have built this set without any instructions to follow. Not saying it could not have been done, but, the craftsmanship is just phenomenal. There are two crystals to select from, however the coil in the oscillator seems to have an awful lot of turns, so, I am thinking the crystals are for the 160 meter band. That is what makes me think that the following tube can be acting as a doubter. I will grid-dip the coils in a little while. I will also research some QSTs to see if I can find this set or a similar one, as again, I find it hard to believe it was just put together by an average ham of that era.

This would be a fun set to try and use in the '29 AWA affair in conjunction with my Grebe CR-18 special. I was just looking at Steve (VE7SL's web page, and, saw that crystal control rigs are not allowed in the '29 affair. I wonder why that is and who came up with that silly rule. Crystals were used by hams as early as '26 if not earlier. I will keep you guys updated on my progress. It will be a challenge to build a time correct power supply for the set, especially for the transformers. There are 15 wires coming out of the real plug. 73 - Mike

I knew Bruce pretty well, and, never had a problem of convincing him of reality. So, while it may be true, I am not sure why Bruce would insist on it, knowing full well that crystals were being used at the time. I'll have to ask Bill Hurni about it next time I see him. I can always fall back on my other 1929 rig, This is a transmitter/receiver that I have had for 23 years. Quick and lousy camera photos attached. 73 - Mike

Hi Mike,
      One only has to read Bliley's history of early "piezoelectric" experiments to realize that crystals were in use,
by amateurs, before 1929. There is even an article in QST in 1927 describing their use.

The explanation I had heard is that although xtal control was certainly being used by amateurs in 1929 and before, it was not typical - only a handful of hams were doing it. I had also heard it was Bruce Kelley's decision and wish not to allow xtal control for the event.

Could not agree more Mike...why the use of xtal control is not allowed is hard to understand. Maybe Bruce just wanted signals to sound crappy.

Roger –

Yes, even the first edition of the ARRL handbook of 1926 has crystal control circuits in it. I have yet to research my QSTs, to see when they first appeared in there. I want to look through them anyway as I am hoping my transmitter or something close to it, will be in one of them. Thanks & 73 – Mike

Hi Mike,

One only has to read Bliley's history of early "piezoelectric" experiments to realize that crystals were in use,

by amateurs, before 1929. There is even an article in QST in 1927 describing their use.

Hello Mike,

This will be the focal point of your amateur gear collection.

This would be a fun set to try and use in the ’29 AWA affair in conjunction with my Grebe CR-18 special. I was just looking at Steve (VE7SL’s web page, and, saw that crystal control rigs are not allowed in the ’29 affair. I wonder why that is and who came up with that silly rule. Bruce Kelley. Not difficult to understand why...

9737. REL 175 Test Results

Yahoo group: AWAGroup (2014 — 2016)

Thank you all for your input.

As you recall, the problem was that the rig would not maintain oscillation with or without a load. As well, when I added a short length of wire at the RF end of the RFC the transmitter worked fine for what it is etc .

....what happens if you temporarily substitute a different choke? You could eliminate this possibility by simply disconnecting the B+ lead, and adding a pi wound 1 or 2.5 mh RFC in series with the B+ lead. With a National R-100 (2.5 mh) both in series with and substituted for the REL choke, the rigs performance was unchanged.

First, one or possibly both of the fixed caps (grid leak and DC blocking cap, in the shunt fed plate ckt) may be defunct. I would suggest substitution, with known good modern units I did this, no change.

Lou – are you saying it oscillates or draws plate current with the key up? No. Key down only.

Try putting .002 bypass condensers from the filament terminals to ground and B+ to ground. I have not done this yet. Afraid that if I re-work things the rig will start looking a bit ropey. I'll rig up two new .002s with clips and give that a try, but wanting to keep the rig original I would not make a permanent addition.

Also try connecting the tuning condenser leads to the same points as the other leads connected to each end of the coil. Meaning to maximized the tank L. I have, no change.

You didn't mention if you tried different locations for the ground tap after the rebuild - I test taped one half of the windings in from the grid tap end with the third winding giving the lowest Ip. Unlike the Hull Hartley, this tap position does not seem to be all that critical.

I found that with the tank condenser rotor tap placed one turn in (shown below), the rig keys, oscillates and sounds fine. Although the cause of the above problem has not been determined, I consider this project finished and ready for December 6th. I have not giving 40 a serious go with this rig. I need to build up my nerve...

A week ago 7Sl got up a 2AM to make a SKED on 80. It may have been this 175s only QSO to date. Static crashes were awful, but the 175s signal got through.

With thanks again, Lou VE3AWA

It is, of course, necessary to shunt the tank condenser. The optimum position of the ground / centre / cathode tap (take ur pick) did not change. (See under coil photo...)

Awhile ago geo, VE3GZB and his wife, Yvonne spent a day with us. George brought along his new oscilloscope and analyzer. We were both surprised that the 175s signal was as good as it is.

80 Mtr. fundamental at far left.

Lou;
Thanks for the note on the Linc C. contest.

I was looking at projects (receivers) and I came upon this QST article.

For anyone interested in the old QST articles on theory and projects in xtal control of xmitters, and stable free run xmitter ckts; please go to the ARRL TIS pages and look up:

QST Issue: Feb 1930
Title: Notes on Radio Frequency Resistance of Inductances
Author: W.H.F. Griffiths

Yes, the title is correct.

This "Experimenters" section article gives a list of the most well liked reference articles published over the years in QST up to that time of 1930 (and in the other journals too) using xtal control, and circuits that were, state of art, in stable oscillators.

Included are articles in highly stable, non xtal controlled xmitter approaches as well.
See the last page for all the articles.

The list also notes the 1927 Piezo article by Crossley that had been mentioned by a list member.
However this may not be available to most, since it really was an article from the IRE; on page 9, Jan 1927.
The author was trying to be thorough.

Also included is a nice experimental data and theory article on what the resonant coils should be made of.
A good find, given all the discussion on the list about coils, stability, and the like.

Many vendors and amateurs felt for whatever their reasons, that a nice shiny coil had to work the best.
But depending upon the wire, or plating material chosen; the coil may actually become very very performance poor.

I recommend that all who wish to build the old xmitters; read it.

Within my long EE career, I wish I had come upon a penny on the sidewalk, for every time nature showed that it could care less for what we think should be the natural thing to do.

Regards,
Louis N3OL

That seems kind of ass backwards. In the OT contest I usually used a Meissner Signal Shifter for the transmitter, which was 1939 vintage, and frequency agile. So, in that contest people usually got on your frequency in reply to a CQ. In the 20's people would call on one frequency and then listen on the whole band for a reply. So, if someone was crystal controlled, they would have a nice stable signal to transmit with, and, he could tune around for replies. There would be no mutual chasing up and down the band. Kind of like Novices used to do with a limited number of crystals in the 50's and the 60'. 73 - Mike

Scratch the request below, folks. Looks like the actual number is 612.
which would make sense because I think it can run from 6V or 12V DC. The
tag on the back sure looked like "6T2" to my old eyes. I think I can
find it now!

-Larry/NE1S

>
> I plan to make the transmitter in the 1929 style. If I was making one in the modern style, I would use a 2000T!
>
> Since I live in the city, I plan is to use it on 80 through 20 meters. That is why I chose the 861 in the first place, because it was the only high powered tube available to the ham in 1929 that was specifically designed for the shortwave. Now if I lived in the country, I would put up a 160M antenna and use a pair of 851's and be done with it.
>
> I started the project 1.5 years ago and am no where near completion. At first I bread-boarded an amplifier, but my power supply wasn't up to the task, the double-spaced National DX plate tuning capacitor wanted to arc, and besides my dummy load was too small. So I wasn't able to get much data and scrapped it.
>
> I suspect that the 861 may not be that great as a class B amplifier. Judging by its characteristic curves, the 861 has rather substantial secondary emission effects, enough to hurt is efficiency. I believe that the 33% efficiency in class B shown in the data sheet is substantially too optimistic.
>
> Since I do not know how well the 861 will work in different types of service, I am building the power supply for the transmitter to be universal enough for a variety of different applications. It will put out 2500v, 3000v, or 3500v at up to 1A.
>
> The following configurations will be tried in this order and I will use the first one that gives reasonable performance:
>
> 1. Class C push-pull screen modulation. This one is best since it should give slightly

higher efficiency than a class B linear, it requires no regulation of screen and grid supply, and is easy to switch to CW operation. It is also believed to be 1929-compatible.
>
> 2. Class B push-pull linear amplifier.
>
> 3. Class C P-P 861's with class B P-P 849's as plate modulators. This method would give enormous power but was not invented until 1931. A 700w modulation transformer would have to be wound. Heising modulating class C 861's was also considered, but was rejected due to the enormous amount of heat that would be released.
>
> 4. Class B linear using 849's instead of 861's. I bought a pair of 849's to use as backup in case my 861's are bad.
>
> Here is the tentative schematic for the screen modulated prototype I'm currently building:

Hi Louis,

First-off, please don't credit ME with that superlative craftsmanship---thank Jon (AB09ZG) for that! It's all his, & his alone...

Several years ago I tried---unsuccessfully---to get my mitts on a good, working 861, and the project saw a glint of promise---a glint about as bright as the filament in the tube that was oh-so-generously sent to me by John Rollins (W1FPZ), just minutes before the thing expired in a wisp of white smoke inside the tube envelope...! I have never found a reasonably-placed replacement, either, so I gave-up on the project...

I CAN answer some of your questions (below), and I shall high-light my responses in red, for your convenience...

Thanks for the note from a kindred soul, though, Louis...

ANSWER: Check in any 1929 issues of QST magazine, Louis---I think you'll find several introductory pieces therein written about both tubes. Practical articles on the 860 appeared in plenty in post 1929 QSTs---there was a piece on the 861 in a 1929 copy, though (can't recall the month now).

>
> Also, the classical high power, B+ supply in the schematic is a real beast, and I have been contemplating building the same one using the 8008; and as you know, an equivalent of the 872.
> I do not know, beyond theory, how to handle the possible issue of RF noise generated by the rectifiers.

ANSWER: If memory serves me well, Louis, one can build simple parasitic suppressors for those big jug rectifiers, mounting them right at plate caps, much as you would a QRO RF amplifier tube. Check the 1930's / 1940's ARRL HANDBOOK for practical examples.

>
> I have done a good deal of reading on the subject of noise generated by Mercury vapor rectifiers.

Hello,

I've wanted to add a permanent band-spread condenser to my TNT for a very long time. With the help of Jon, AB9ZB and his lathe I have just finished installing one.
Thank you again, Jon.

I assume that this is a BC set neutralizing condenser. Anyone know its maker?
3/8" dia. hardrubber rod. Shaft dia. 3/16".

With the tank condenser tuned to 3565 and the spreader at mid setting, the Kelley window is just covered.
Hand-effect (and shock hazard) is nil...

1-10 mmfd. / 2/16" CU tubing

Looks like there is enough there to do a bang-up restoration.

Anyone know its maker?

It looks very much like the one on my MOPA, which says "MARCO". I ended up
just using one rotor and stator plate each, and functions more like a XIT
with a range of only a few kc on 80m.

Below are two oscillator circuits for the REL 215 three stage rig.

The orignal Hartley circuit. Note the fixed capacitor (200 mmfd. Sangamo) across C1 making this a Hi(ish)-C ckt.
See ckt. below this...

Same rig, but with a later, revised oscillator circuit. Note grid coil L5, that the tank coil is not tapped and the C1 padder has been removed.
From the catalogue, "This addition [L5] results in a more efficient combination, that is, greater output for the same input."

Does anyone recognize this type of osc.? Any suggestions as to what the L5 inductance would be? Same as tank?
Tks, Lou

This is nearly an exact replica of the 30-watt novice transmitter that appeared in the ARRL Handbook from the late '50s through the mid '60s. Mine was built in 1970 when I was in the 7th grade and uses a 6DQ6A, 5U4, and OD3. The 6DQ6 serves as both a modified Pierce oscillator and power amp. Probably 80% of my parts were cannibalized from a 1950s Philco B&W TV set. I also built a matching Monimatch SWR indicator but that's been lost for many years.

Paul, W9AC

GE,

Last night I came across this 6+ page article I'd not read before. Half of the piece deals with oscillators and is very informative. Even in '27 there has talk of Hi-C.

If anyone were would like to read the article, yet does not have access to it in any form I would be happy to scan it and up-load to the Groups files.

Below is a small portion of that article. To the "Pure D.C." Hounds here, please read closely sl .

Some of you OTs out there might remember Art Goodnow, W1DM (SK). Art was a great guy and a good friend. He was also a master at building OT rigs. His pre 1929 transmitters all sounded as if they were crystal controlled, and were extremely stable. Beautiful breadboard construction. He was also a great and smart engineer. He wrote an article in one of the early AWA Reviews, on spark, It was extremely thorough, and I used it extensively when I built my first high power spark transmitters. I also used on of Charles P. Steinmetz's books on HF AC currents. 73 - Mike

Well, I failed to find a relationship between these inductances (and their reactances) with their respective frequencies of operation that would allow one to extrapolate to 472kHz.

Anyone else?

I know this might be unusual, but i am having an idea of using an SDR RX for my RX for 2014 Bruce Kelly contest.

I have one of the RTL dongle RX units and am trying out the Ham it up upconverter.

Has anyone here tried this approach? I thought it would be fun to use a TX and RX just about as far apart as possible in technology. In the past 2 i have used modern solid state rx.

Thanks

Barry

I haven't played with the dongles (please, no obvious comments. Lou,
that means you! ;-)), but I do have a SoftRock Lite II running off the
1st IF can of my Halli SX-28. The Halli is the front end and the SDR is
the backend. Works great, but the SX-28 still drifts :-(

I don't use it in the Kelley, tho. The SX-28/SDR/computer are upstairs,
and the 1929 station is in the cellar.

Barry,
I believe that as long as the following conditions are met you are fine:

The SDR uses a series of 01As as the CPU and for any related logic pieces.
All other functions, resistors, caps etc are 29 vintage
The screen is a series of O1As for pixels.However you can either toggle the filament or drive the plates into red.
The keyboard uses a typewritter with period telegraph keys as switches.

It should be an interesting, but somewhat large and possibly expensive project....

Good Day All,

I have a friend who is just on the verge of seriously tackling a serious vacuum tube regenerative receiver project, but is presently looking for any & all good literature surrounding the genre...

To that end, he has accumulated vintage West Coast & ARRL Handbooks, & various QST articles---but I recommended that first & foremost, he should get his hands on a copy of the book, "SECRETS OF HOMEBUILT REGENERATIVE RECEIVERS" by C.F. Rockey. Unfortunately, the publisher of this book---Lindsay Publications---is no more.

Does anyone out there reading this have a copy that they wouldn't ming parting with...? That, or is anyone aware if this very fine publication might be available somewhere on-liine, for free downloading...?

Any & all leads are appreciated---thank-you!

Hello,

Antique radio enthusiasts may be interested in an article in this week's (Aug 11 2014) issue of Sports Illustrated magazine. It is their 60th Anniversary Issue. On page 58 is an article that begins with the day Major Armstrong died and then briefly chronicles the evolution of sports broadcasting from Armstrong's invention of FM, through the beginnings of TV, to today's multi-media. Among other things are mentioned Armstrong's legal battle with RCA, and his tower in Alpine, New Jersey and the Regency TR-1 transistor radio. I well remember Armstrong's tower as it was clearly visible form my former home town of Rdgewood, NJ.

Roger;

The below is my personal opinion of course, and candid.

I would not recommend this specific Lindsey publication as more than typical, and so to not spend appreciable time finding it.
Some time ago I spoke to the site owner, over the various texts offered, in my area of interest.
In the end, my opinion was that of the above.

It is the typical approach you see everywhere.
Spoon fed for beginners, yes, but the huge number of circuits, also very beginner, to expert level projects, can be easily found on the web and in the old books.

Start by looking up the excellent Dave Schmarder site.
Everything is there from crystal to tube designs, and a lot else for that matter.
He is a member of the “Radio Board” Forum/group.
These people range from bare beginners to engineers, and the Projects, articles/circuits, and Forum questions are a resource.

Now, Books/Journals to concentrate on, are the QSTs of 1935 onward, and the Handbooks of 1946 onward to 1965.
A descent number of articles are available on the TIS resource, for members, at the ARRL site.

More difficult to get, but I must say, perhaps even better than the ARRL handbooks are the “Editors and Engineers Radio Handbooks” (they evolved into the Orr handbooks in the late 1950s).
Now I find these more technical, less beginner oriented, but in return they describe clever regen (and others) powerful receiver circuits. Although Schmarder has very clever stuff.

Now the Lindsey series books “The impoverished Radio Experimenter Volumes 1 – 6, are a good find; with these volumes describing xtal receivers, then advanced crystal receivers, to regen receivers, to three pentagrid converter receivers (the backbone of the AM and FM receivers sold for decades, and I put the three different designs described on a single 15 by 8 inch board).

Then there is his three tube superhet (might be volume 4 ?), which is built from grass roots upward (in fact it gives grass roots a new meaning), including making IF coils out of aluminum foil. They are about 8 inches high and 6 inches across, built of cardboard and foil with holes inside so that the two 6 inch long IF coils can physically see each other),

A great education, since if you choose, you can make everything except the tubes, and crystal detectors.

For those interested, you can make the crystal detectors too (see htt p: // theradioboard.com /rb/viewtopic.php?f =2&t=5700.)
I inserted the spaces to get it through the firewall.
This aerospace firm' firewall, is a hardliner.

Lastly, you should still be able to find most of the very unusual books of the original Lindsey site.
When the Lindsey site owner retired, and the site ended; the rights were moved to a different site under new management, so most of the weird stuff is still available.

Regards,
Louis N3OL

9798. National PW Dial Patent?

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-08-19 00:19:01 UTC
From: JAMES HANLON
Topic: 9798 Message: 9798

Y'all,

For an article that I'm writing for Electric Radio Magazine, I'm trying to find out if there was ever a patent on the National PW dial used on the HRO receiver. On the James Millen Society web site at
http://www.isquare.com/millen/bio_rem/merrill.html
there is an article with a picture that includes “original letters to and from Millen and Clarence D. Tuska relating to the patent on the famous National PW dial drive assembly, often refered to as the HRO dial.” The person who assembled the items in the picture is Merrill W. Bancroft. It was his display at the 2001 AWA Conference in Rochester, NY.

I'd appreciate any information on the subject that anyone might be able to supply, including any leads to Mr. Bancroft if he is still with us and any ideas about the patent on the PW Dial drive.

Thanks very much,

Jim Hanlon, W8KGI

Merrill,

It's great to hear from you and to know that you are still "in the game." Thanks for the offer to send me a copy of the Patent, but I don't need to bother you to do that. I got all sorts of helpful replies to my post. Joe Rubin, W4CBJ, offered to look up the Patent for me. Brian Page, N4TRB referred me to his web page at http://n4trb.com/AmateurRadio/National/Lamb/JamesLamb.htm where he has a copy of the patent posted among several other very interesting things. Bob Sullivan, W0YVA, gave me the patent number, 2060537, and told me it was issued to William Smith. And Tim Walker, W1GIG, let me know that you were still around and that he had seen you at the AWA Conference.

I am continually amazed at what a resource the internet, the AWA group, the AM Radio group, and the Boatanchors group are when I'm trying to find some information for an Electric Radio article.

I have a bunch of submini tubes, some marked 433E and some marked 437E. They appear to be triodes, directly heated, with wire leads. They're larger than my proximity fuze tubes but smaller than peanut tubes. They look like some old hearing aid tubes I have. I breadboarded a couple of them but the results were inconclusive because I don't know how much voltage they can handle. Would anyone have any idea what they are and/or what they were used for? Or even some characteristic data?

From: Art Lebermann
Topic: 9806 Message: 9806

I'm researching the history of the McElroy MT-35 transmitter, and have been advised that one was sold at the ARRL Convention flea market this July. I'm wondering if anyone on this list attended that convention, and might know who purchased the MT-35? Any other info on this very rare transmitter (the "ancester" of the WRL Globe Trotter) would be much appreciated. At last count, there are six units known to exist, with one in the AWA Museum collection.

9807. RE: [AWA Group] McElroy MT-35 transmitter

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-09-02 23:07:02 UTC
From: Carl Nord
Topic: 9806 Message: 9807

It was probably sold by a New Englander as there was one at the New Hampshire Nearfest last spring. The seller wanted $1500 for it

Subject: [AWA Group] McElroy MT-35 transmitter

I'm researching the history of the McElroy MT-35 transmitter, and have been advised that one was sold at the ARRL Convention flea market this July. I'm wondering if anyone on this list attended that convention, and might know who purchased the MT-35? Any other info on this very rare transmitter (the "ancester" of the WRL Globe Trotter) would be much appreciated. At last count, there are six units known to exist, with one in the AWA Museum collection.

The "missing" MT-35 was sold by N2GHD (Grand Island, NY). Unfortunately, he does not know the name of the person who bought it.

How about this one Mike?

Tested and very close agreement with my Fluke RMS DVM.

One very small chip on inside edge of rim. Small scuffs on bakelite faze bezel. Glass and printed meter face flawless. "R131" scratched into rear plate.

Date: 2014-09-25 12:22:24 UTC
From: Bill Stewart
Topic: 9816 Message: 9816

GM all,
The saga continues with the little '24 Meissner. A few months ago I added a sampling coil to be able to hook the rig to the coax fed Inv. L. I think I have squeezed abt all the RF I can out of the '01A and have begun testing on 160m. A few nights ago I did some CQing, mostly to see if I was getting into any RBN rcvrs and to my surprise I got a call from Mike, WA3TTS, in PA. He gave me a 579 rpt. I gave him a 479, due to QRN here. How 'bout that...so, looks like, with luck and good condx, I might be able to get a sig up to the North during the BK...sure hope so. I was also getting into some RBN rcvrs from VA into PA...weak in some spots, but pretty good in others. Mike later sent me an email with a link to a You-Tube video of our QSO and some pix I sent to him later. If interested, pse check out this link (click on 'show more' to see pix):
https://www.youtube.com/watch?v=nv8B52yslxo
One of these days I will get to a period p/s and rebuild the rig to look better...but hate to disturb anything since it is working. Plus, I'm getting the BK fever...abt time to start dusting off the Hartley.

Steve -

I apologize for the delayed response. Boy, this would be ideal, however, I need the earlier style 476 that has thinner and metal mounting rim. I believe the older style may also have been slightly smaller in the body diameter. Thanks again & 73 - Mike

Not much to tell, really. Just been talking to my New England buddies on 75M AM with the plate-modulated Hartley lash-up that's been on the air for several years now. Most of my opearation is from 7AM to 9AM on 3870 - 3885. The receiver I've been using with it is the RME-69. I tried the SW-3 but I need to work out some kind of muting - even with the RF gain all the way down it blows the cans off my head when I transmit. Pretty much the same as with the 2 homebrew regens at the operating position.

Larry,

Do you plate modulate your Hartley oscillator (http://ne1s.rfburn.org/Hartley.JPG) or did you add an amplifier that is modulated?

Niel,

I plate-modulate the oscillator directly! The way I do it, it's not nearly as "bad" as you would think. I've posted on what I've done several times before on this list,; I've even posted sound files recorded by N1BUG at his QTH, with and without the BFO on so that you can hear how much/how little the carrier "wobulates."

Yesterday I picked up a clean model 33 with the matching E3 speaker.

The 33 is very clean but the PS was not available.

The E3 looks good but needs the lining replaced. I removed the front cover and speaker looks to be recently replaced. I removed the two nuts on the rear thinking the mechanism and speaker would fall out but no luck. Is there something I need to know to remove the innards in order to replace the lining?

Also, what PS or PSs should I be looking for to complete the set?

Thanks.

9833. 1924 Period Correct Pwr Supply

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-10-21 18:49:29 UTC
From: Bill Stewart
Topic: 9833 Message: 9833

GA,
I am still dinking with the '24 Meissner osc. It is working well and now have it feeding the Inv. L.
I have been making a few QSOs on 160 over the last month or so. Yes, this project has been going
on for a couple of years....and yes, I'm slow. The next chapter to this saga will be a period
correct p/s, for AWA use. Has anyone run a '20s xmtr using RAC or self-rectifying. From what I have seen, there were not many rectifier tubes available in '24....maybe 'S' tubes. Many xmtrs were run with AC on the plates. I am using a single C-301A and am wondering how to run one using AC on the plate. By the way, I'm using 300vdc B+ (Heath Bench supply) so the tone is pretty good. Any other ideas (other than pie-pan capacitors & 40-jar rectifiers).
I would love to build something as near as possible to being from the 1924 time frame. However,
I may have to cheat and use rectifiers which came out in 1925....ain't I nit-picking.

Anyone have some good 'skinny' for doing this?
Tnx...73 de Bill K4JYS

Hello Bill,

Once again I see that we are kindred spirits in this.

Has anyone run a '20s xmtr using RAC or self-rectifying. RAC? I have. If you wish a 'phone QSO regarding my results, please send me your number and time I should call. So do so now would be fine.

Hello,

I am looking for a accurate 100 D.C. milliamp metre for test-bench use such as below or the Weston equivalent. Face diameter 3 1/2" or the somewhat smaller metal case type. It does not have to be pristine. Any physical condx will be considered. Cash money or trade. All postage covered.

Tks, Lou

Any of you have an SW-5 on 80 and 40? In setting mine up for the BK I discovered feedback caused by the tuned RF stage to be a major problem. Any other similar experiences? My solution was to turn the SW-5 RF stage into an untuned RF stage. See my blog at http://w0vlz.blogspot.com/2014/10/2014-bruce-kelley-1929-qso-party.html for details.

Niel -

There are dozens of sites with thousands of free fonts. I use <www.fontspace.com> and <www.dafont.com>.

The 'QST' is almost certainly hand cut. The 'Amateur Radio' looks kind of like Cooper with shading.

9846. Mini Night of Nights! - MRHS Newsletter No. 49 / 630 Mtr Activity Night

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-10-29 19:42:25 UTC
From: Bill Stewart
Topic: 9846 Message: 9846

I copied ITEM 1 from the topband list (via Steve, VE7SL) and thought it might be of interest to some of our list members. ITEM 2 is from the Maritime Radio Historical Society (MHRS). They are also participating in the 600/630 meter event. Looks like some interesting activity coming up this weekend.
73 de Bill K4JYS

ITEM 1
"I know that many topband operators are interested in and are following the activity on the 630m band (472 - 479kHz) as agencies work towards this becoming a ham band in the U.S....some of you are even transmitting using an experimental licence. All Canadian amateurs gained access to the new band in May of this year.

This coming weekend, a 630m Activity Night will see many experimental stations on the air, including some of the old Maritime CW stations. As well, on Friday night only, three Canadian stations...VE7SL, VE7BDQ and VO1NA will be operating in the 'crossband mode', transmitting on 630m CW and listening for CW replies on designated HF frequencies. Hopefully many of you will take a look for us during our scheduled operating times and if hearing us, would give a call on HF....we would love to work as many as possible during the Friday night event. All three stations will be running the maximum erp and with the improved propagation conditions of fall, hope to be workable throughout many call areas in Canada and the USA.

For the finer details of times and frequencies of the crossbander operation, as well as a link to the ARRL's news description, please see:

http://ve7sl.blogspot.ca/2014/10/630m-crossband-activity-night-reminder.html

You shouldn't need a fancy antenna to just listen on 630m but you will need to be able to switch between listening on 630m and then transmitting on HF, perhaps using two different antennas to make it easier...or maybe just A/B switching your antenna selection manually. We hope to hear many of you calling on Friday evening!

73 Steve / VE7SL"

ITEM 2

"> Mini Night of Nights 1 November - MF Madness!

In Newsletter No. 47 we announced our Mini Night of Nights event to take place on the evening of 1 November (Pacific time). We're happy to report that those plans are still on and that members of the Transmitter and Operations Departments have stepped up to assure that KSM (and K6KPH) will be standing tall. Plus Bill Ruck has offered to feed the staff with his famous radioman's hash (not made from real radiomen we hope) and Chief Operator Dillman will be supplying an example of his "my o my" key lime pie. We may have to use

large pointed sticks to prod the operations staff out of the kitchen and back to their operating positions. Ruck, being "Morse challenged" as he puts it, will not receive such treatment.

What's the idea behind this event? Well, we know it's tough for many folks to copy the MF signals of KSM during our normal daytime (Pacific time) operations. We've often thought about a Mini Night of Nights during the winter that would continue into the evening hours and emphasize MF operations.

The propagation of our HF signals will be different too, so listeners beyond MF range may be able to copy us at locations where we are not heard during the day.

How late will we stay on? That's hard to say since it will largely depend on the sleep inducing qualities of the excellent meal provided by Ruck. But on the regular Night of Nights events we usually run out of steam at about 9:30 or 10:00pm Pacific time so it'll probably be similar for M NoN."

Here is more info from the MRHS:

9853. de K1TG - Info needed for RME LF-90

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-11-01 16:02:42 UTC
From: Roger Kuchera
Topic: 9853 Message: 9853

Gentlemen,
I seem always to be looking for information on one oddball piece of vintage gear or another. Once again, I am in need of data. Namely, alignment data on the RME LF-90. This is the low frequency adjunct to the RME-69. There is a paucity of info on this particular item. To date, all I have found are 2 pages from an old Rider's Manual. I did find a reference to alignment data on one site but all it did was lead me around in a circle back to manufacturer's home page. Surplus of Nebraska has a listing for a manual for the LF-90, which I have ordered.

If I am able to gather enough data, I will submit an article to Electric Radio. Is there any one of our august assemblage who might be willing to share info on this rare item?

Thank you.

CUL, Roger/K1TG

9858. Getting Ready for the Kelley Party #1... On the Windom antenna

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-11-01 21:46:50 UTC
From: Louis Vermond
Topic: 9858 Message: 9858
Attachments: 3 described; binary payloads are missing from this source WARC

Originally from KK7UV to VE7SL & VE3AWA

Drawing from: How to Become a Radio Amateur, 1st edition, 1930

Windom mentions a "normal half-wave radiator with a single wire feeder" and notes the high standing wave on the feeder. Starting with the single-wire feeder at the center of the half-wave radiator and moving it outward he claims the standing wave on the feeder "began to disappear", and at a "very definite point the feeder curve became a straight line".

Looking at this in EZNEC:

For 3560 Khz and trimmed for zero reactance, I got a center Z of 71+j0 for a 135.5 foot wire.

With a 135-foot single-wire feeder and fed against ground, the Z is 843-j1134

The current distribution is not flat as Windom stated.

I moved the single-wire feeder connection to the magic spot 18.82 feet from the center (as per Windom's formula).

The Z is now 1458-j1090 and the current distribution flattens out as Windom claimed.

The feeder is still radiating however and probably does not jive with what we would call a feeder or feedline today, which we do not wish to radiate.

W8JI provides the following comments on the Windom on his webpage:

The current distribution flattens as the surge impedance of the single-wire feedline matches that impedance at some point on the horizontal wire.

The Achilles heel of the original single wire Windom is the single-wire feeder. It has no "return conductor" or shield, so the single-wire feeder:

1.. radiates and couples to everything around it. This causes TVI and RFI and couples local noise into the receiver.
2.. causes considerable common mode currents along the feedline and at the matching system. The common mode currents and strong electric field extending a considerable distance from the feed wire causes RF grounding problems and common mode currents in the Hamshack and on all the shack wiring and equipment.

Topic: 9858 Message: 9859

Hi Lou,
I haven't completely digested this info yet but will later.
I have been using this antenna since I started in the AWA and wrking
the BK events....since around 2000. It is the recommended antenna for
use with the TNT in the Dec '29 QST. With one at abt 30 ft, I worked
W6, on 80 with the 2 watt '29 TNT. I have also worked VE7SL several
times on 80 & 40, with the one now in use, at abt 40 ft. I used the
charts from the orig. '29 info. I believe it was called the off center
fed hertz then. I also use it with several HB rigs. It works quite well
on 80, 40 and have used it on 20. I have no problems with TVI or RFI
in the shack but that may be due to the low power. As a general rule I
work a goodly number of stations in the BK.

I have no idea what the swr is...no good way to measure. I believe some-
where in the old info, it is said that if the feed line is connected to the proper
point, per formulas, the swr will be of no concern. Feed line lgths can be
very long with no losses except resistive in the feed line. I have no fancy way
to analyze this antenna, but from my experience I would recommend it for
the BK, other AWA events and general amateur use.

Tnx for passing along the technical notes on this antenna.

73 de Bill K4JYS

Just finishing the restoration of a Hamarlund Comet Pro. Version 2 CA 1932

The IF gain control in mine works backwards to what I am used to. It would be better off if it was called "IF attenuation"

That is as you turn it clockwise, the gain goes down. Counterclockwise and it increases.

If that is how it came from the factory I want to leave it that way, but mine was modded a lot in its life so it is hard to tell what is truly original and what is a change.

So I thought I would ask others.

Thanks

Carl Nord

Subject: [AWA Group] Hammarlund Comet Pro Question

Just finishing the restoration of a Hamarlund Comet Pro. Version 2 CA 1932

The IF gain control in mine works backwards to what I am used to. It would be better off if it was called "IF attenuation"
That is as you turn it clockwise, the gain goes down. Counterclockwise and it increases.

If that is how it came from the factory I want to leave it that way, but mine was modded a lot in its life so it is hard to tell what is truly original and what is a change.
So I thought I would ask others.

Thanks

Carl Nord

I guess you've got it working and receiving signals now, Carl? Congrats!

Sorry I can't help with your inquiry. The RF gain control on my RME 69
works the same way, but I think that's because the control was replaced
and has a switch on it to disable the AGC.

83,
-Larry/NE1S

Carl...

I have an early Comet Pro (in wood cabinet), though I'm not sure of the version. It's un-restored, and I've never applied power. If you don't get the info you need, let me know - I may be able to help.

73,

Since it gives an output impedance, I would assume it is dynamic. 73 - Mike

Well, in that case, take an ohm meter, put it on its lowest range, and see if you hear anything from it when you touch it to the output leads. A small battery would work as well. If you hear something, like a click in a pair of headphones, then it is indeed dynamic. You could also try to pump audio into it, like from a receiver or a sig gen. 73 - Mike

Here's a neat ~17 minute podcast on Radio Row in NYC, but you need to
suffer through the first few minutes of intro/commercial. There is also
a 1929 video (with audio) of Radio Row on the page that is 2-3 minutes long.

The 2014 Bruce Kelley 1929 QSO Party and W2ICE Special Event Station
The Bruce Kelly 1929 QSO Party is a yearly AWA sponsored event where participants build their own transmitters using the designs, techniques, and tubes that were available in 1929 and earlier, and then put those classic transmitters on the air and try to contact as many other 1929 stations as possible. Since they use early designs, it is a cacophony of whooping, chirping, buzzing, clicking, drifting, swishing, swaying, warbling, and other interesting signals. This is what ham radio sounded like in 1929 and for two weekends in December its 1929 again on the ham bands.

This year for the first time we are activating Bruce Kelley's W2ICE call sign as a 1929 SPECIAL EVENT STATION! W2ICE hasn't been heard on the 1929 QSO Party since Bruce's passing so this will be a real treat to hear and work the namesake station of this event! A special event QSL card will be available for valid contacts with W2ICE. QSL information will be posted on the AWA website. W2ICE is operating as a 1929 station and contacts count just like any other station. The 1929 QSO Party was started in the early 1990's and championed for many years by Bruce Kelly W2ICE, an AWA co-founder. Prior to Bruce's passing, he asked his close friend John Rollins W1FPZ to keep the 29 QSO Party going. John Rollins managed the QSO party for many years and renamed it the Bruce Kelly 1929 QSO Party in honor of Bruce. Ten years ago John Rollins asked me to manage the 29 QSO Party for him and Bruce, and to keep the event alive because it meant so much to both of them.

Dates: Sat. Dec. 6, 2014 @ 2300 GMT to Sun. Dec. 7, 2014 @ 2300 GMT and Sat. Dec. 13, 2014 @ 2300 GMT to Sun. Dec. 14, 2014 @ 2300 GMT

Objective: Contact as many 1929 stations as possible. Contact exchange consists of RST, Name, QTH (State such as ME or MN or NY), last two digits of the year of the transmitters design or publication (such as 29 or 27 or 23), type of transmitter (such as TNT or TGTP or MOPA or COLPITTS), and power input (such as 6W or 9W).

Rules: Transmitters must be 1929 or earlier types of self oscillators such as the Hartley, TNT, PP tuned grid tuned plate, MOPA, Colpitts, etc. No crystal oscillators. Tubes must have been available during or before 1929. Typical tubes often used are type 10, 45, 27, 211, 71A. Individual stations can be worked only once on each band over the course of two weekends. You can use any vintage or modern receiver that you wish. The event is open to all 1929 stations including non-AWA members and AWA members. You are encouraged to join the AWA and support 1929 radio!

Input Power: Transmitters are limited to a power INPUT of 10 watts or less. However, to help make East-West contacts, power may be increased to 20 watts INPUT between the hours of 0500Z (12 Midnight EST) and 1300Z (8 AM EST). Note this is INPUT power. Power input is calculated by multiplying PA plate voltage x total PA plate current. Example: my plate voltage is 300 volts dc, and plate current is 30 ma, so total input power is 300 x 0.030 = 9 watts input. Stations running more power than this are considered "modern" for this event and do not count.

Frequencies: The QSO Party typically operates between 1800 to 1810 Kcs, 3550 to 3580 Kcs , 7100 to 7125 Kcs, plus or minus depending on QRM. 40 meter activity is up significantly because it offers both night time AND daytime propagation! So when 80 shuts down Sunday morning, I hope to see you on 40m.

I propose we change the rules of the BK. Let's make sending Bruce Kelley's last name part of the QSO exchange. Only those who properly spell it may receive credit for the QSO. ;-) Sorry, I couldn't resist.

I was away from radio for a while. I'm back and hoping to make an appearance in December. Barring a storm like the one we got November 2 that is. No power for 24 hours (many are still without) and significant antenna damage.

Gentlemen,
I am not a participant in the Kelley venue but I would like to take issue with one of the rules, to wit: "must use a handkey." In view that most SEOs are keyed in the center-tap, I would question the safety of not using a relay. Surely, we could err to the side of safety. Just a thought.

Roger,

I, for one, can no longer handle a straight key for contesting or long QSOs. Fortunately the straight key restriction is not in the latest set of BK rules posted at http://www.antiquewireless.org/awa-on-the-air.html . I'll probably switch off between straight key and keyer throughout the BK.

Yes, that guy on the left bears a striking resemblance to Edward G. Robinson (aka Rico in the talkie "Little Caesar"). The Federal Government refers to anti-racketeering laws as The RICO statutes.

Indeed the "Chopper" cum "Chicago Piano" was a product of the Thompson Co. It's Army designation was the M1928(A1).

All you ever wanted to know but were afraid to ask! :) :)

Roger.

Hi Lou,

Looks that way, I'm afraid...!

Just no desire here at all to re-string my all-band dipole, which was a casualty of last December's ice storm that we experienced here. The pain in my legs---and now, my back---forces me to have to sit down after just 10 minutes of even the lightest of physical exertion.

I went for an MRI last Monday, & see a back specialist in a coupla weeks, to see about a possible pinched nerve condition in my lower spine. I sure do hope that it's "repairable" as it's making things that I used to love passionately---like tending to my antenna farm---a real unpleasant challenge anymore...

I have come to appreciate that old saying more & more with each passing day of, "Even a millionaire has nothing, without his health."

Roger,

Just key the relay with your straight key. You might want to put a diode across the relay coil if it's a DC relay, reverse biased when the relay is energized, to adsorb the inductive kick when the key opens. Otherwise you will have a HV spike across the key anyway.

Also, if the rig is cathode-keyed (as opposed to negative-lead keying) the voltage across the open key is limited to the cut-off bias voltage for the tube at the particular plate (& screen grid, if it's got one) voltage applied. Note that for tetrodes where the screen-voltage is derived through a dropping resistor from the plate supply (causing the key-up voltage on the screen grid to equal the plate supply voltage, since no current is drawn by the screen with key-up), or for low-mu triodes (commonly used in 1929 rigs), the voltage across the open key can still be high enough to be dangerous.

Negative-lead keying potentially (pun intended) puts the entire plate supply voltage across the key,

The difference is where the grid circuit return is connected. If it's grounded at all times - i.e., connected to the power supply negative lead at all times - it's cathode-keyed. If the grid circuit is returned drectly through the cathode, so that the grid floats on key-up, it's negative lead keying.

I've used cathode keying for all my old-time transmitters and have never been bit; I've weighed the risk and it's one I'm willing to take. YMMV.

A few weeks ago I bought a very rare Marconi key on eBay. This is the link:

http://www.ebay.com/itm/141450857712

I am in the process of cleaning it up. Unfortunately the main lever is bent sideways. I have no idea how that could have happened as it is slightly over 1/2 inches wide and 3/8 inches thick. Regardless, I would like to attempt to bend it back, but, could use some suggestions. I do not want to heat it as that will discolor the brass. I am going to try to take it out of the frame so all I have is the bar, and then I can either use a soft but heavy mallet on a rubber pad so it will not get nicks, or, the other thing I thought of was to wrap it in thick rubber or leather, and then put it in a very large wise. Suggestions are welcome. Thanks & 73 - Mike

Wood is good, but I've found pine too soft for that job. Try soft maple that has been pained down VERY flat and smooth. If the length ends of the two slats do not extend beyond the armature length, round and sand the end edges of the wood to avoid marking the bass.

Mike, I saw that crack and got jittery. Maybe just leave it alone and call the bend part of it's story.

Lou –

I agree, pine may be too soft, but, using wood is a good idea. Especially now since I did a little more work on it. I was able to remove the long pin through the lever, however, the two pieces on each side of the lever, which I thought were just washers, are part of the lever. So, I will have to drill a hole into each piece of wood to accommodate the side pieces. I think I will need at least ¾ inch wood pieces on each side. I believe it will work if the wood is hard enough, as the lever is massive, but, so is my large wise, HI. I feel pretty confident that it will turn out OK. Thanks & 73 – Mike

I don't get this. I think it's important to understand one's equipment and the risks involved, so that one can make an informed decision.

> Safety first!!

If we take this literally, we would have all our 1929 rigs totally enclosed in grounded metal cabinets, and live in a protective bubble. "Safety first" is more like an empty slogan used by politicians. There is a cost to everything, and, more often than not, engineering is an art of compromise.

Interesting! Look at the image that I think is trying to show the width? It appears to start at 7/8” and end at 3-1/8” which makes it 3-1/4” wide... why wouldn’t you line up the tape with an even number like zero or 1”??? Just curious...

Sounds like a fun project, Don. There was a good-performing regen which
was an ARRL design from, I think, the 1960s which used a pair of 6AQ5s.
The 6AQ5 is simply a miniature version of the 6V6.

It was good to catch you on 40M AM yesterday.

73,

Situation:

Winding tank coil

80 mtrs
10W max.
#12 enamelled
3" dia. form
360 mmfd. shunt variable

It is customary to space the winding turns the diameter of the wire. With above in mind, is any spacing really necessary? If so, why and suggested minimum spacing required, please.

Tks, Lou

Lou,

What sort of circuit? I've never tried it but I would think close spaced with be OK for a TNT or TPTG. A Hartley will need spacing to allow some sort of movable clip. Other than that, the capacitance/inductance tank combo needs to be resonant at the low end of 80 at close to maximum capacitance.

August and September 1928 QST recomendation is for copper tubing for mechanical stability and to allow high current w/o losses. Why the enameled wire?

From: Niel - W0VLZ
Topic: 9923 Message: 9923

I've been playing with my Hull Hartley (http://w0vlz.blogspot.com/search/label/1928%20Hartley) on 40 to get ready for the December BK. I've had noticeable (by 2014 standards) drift during a transmit cycle. Tube warmup while calling CQ will cause my signal to drift a couple 100 cycles. It drifts back/cools off while receiving and then drifts all over again during the next CQ. This is even while running my '10 at just 6 watts input.

Any similar experiences out there?

Any solution other than keep it short?

73,
Niel - W0VLZ

Like Neil said, if you need to tap the coil (as is necessary with a Hartley, or if you are tapping the coil for the antenna feed) it will need to be spaced. Otherwise, I think at these power levels you could get by with a close-wound coil as long as the integrity of the enamel or other insulation is good. However, you may find that to achieve the same resonant frequency you will to use less breadslicer capacitance because of the added turn-to-turn capacitance.

Neil - I think there is a similarity between the tap point on the Hartley's main tank and finding the correct inductance in the TNT grid coil. If the TNT grid inductance is off by even a couple of turns, the plate current increases several ma. but the output power does not...leading to increased plate dissipation (more internal tube heating) and consequent short-term drift. If the grid coil is optimized, the short term drift pretty much vanishes.

I've noticed on my own HH that even a quarter turn difference in the tap point (especially on 40m) can make measurable changes so if you haven't already tried some small changes in the tap, you may want to look at that.

Hi Lou,

IIRC, I have read that the inductor Q of a space wound inductor will be higher.

If for no other reason, the parasitic capacitance, between coil turns, will be lower for the space wound version. This yields a higher L/C ratio, and thus a higher unloaded Q, and lower losses.

In addition, the dielectric of these parasitic caps will be mostly air, in the space wound version, even if the enamel coating remains intact, as the enamel coating will only represent a small percentage of the total dielectric "thickness", of these undesirable parasitic capacitors. The losses of the enamel dielectric (close wound version) will be greater than the mostly air dielectric, space wound version.
Also, the capacitance of these undesirable capacitors will be increased due to the increased dielectric constant of enamel vs air. Sort of a triple "whammy", IMHO.

Lower losses yields more power out & less potential for freq drift.

Hi Ron,

...space wound inductor... Lower losses yields more power out & less potential for freq drift. Space wound it will be then, Ron. Thank you as well.

Practice.
Have it on best authority that maintaining spacing with string is permissible. Of course, the string must
be waxed to prevent moisture absorption that would cause power losses.

Lou,

The wooden box on the window sill is my 2.5/6.3/7.5V @ 7A filament supply. I have it close to the transmitter to keep IR drop minimized...probably not much of a problem with only one 210 but why tempt fate.

Left to right you see the 200-315V regulated B+ supply for the Hartley, 100mA plate current meter, SW5 power supply, 7A filament supply, National SW5, Hull Hartley transmitter, homebrew straight key (matches closely the one pictured with SW5 and Hartley on Feb 1931 QST cover) and a small rack with speaker, Baldwin headphones, TR switch, KX3 with battery (freq monitor and backup rcvr).

More details at http://w0vlz.blogspot.com/

Niel - W0VLZ

GA all,
I recently received a spider-web coil from an eBay auction. It looks like a Reinartz type coil. It is called a 'Cypress Coil' and made by Wianco Quality Products in Brooklyn, NY. Info says its for 'Amateur and Broadcasting wave lengths'. Does anyone know anything abt this coil? I've attached a couple of pix...hope they go thru.
Tnx...73 de Bill K4JYS

I just happened to run across it. Apparently the guy had sold others, and I got the last one. Price was good so I picked it up. You are probably right..something around '23 or '24 would be perfect. Not sure just how to hook it up, but maybe that can be figured out.

Interesting to find this email in my in-box after just coming home from the annual 2-day meeting of the Southern California Antique Society (SCARS) in Carlsbad, CA, where I was awarded first place in the homebrew radio contest for my version of the 1922 Reinartz regenerative receiver. It uses an original Reinartz coil that I bought many years ago at another SCARS swap meet. I have a complete story on this receiver in the December 2011 issue of Electric Radio magazine. FWIW, attached are a few pix of my original Reinartz coil and my hombrew version of the Reinartz receiver described by John L. Reinartz in the March 1922 issue of QST magazine.

Howard,

(you may already be aware of all of this but it never hurts to put the word out again)

VE7SL's website at http://members.shaw.ca/ve7sl/ and his blog at http://ve7sl.blogspot.ca/ has outstanding information, hints and tips about building 1929 style transmitters. You might start with three of his blog entries:

http://ve7sl.blogspot.ca/2014/10/building-29-style.html
http://ve7sl.blogspot.ca/2014/10/29-style-transmitterswhat-to-build-part_20.html
http://ve7sl.blogspot.ca/2014/10/29-style-transmitterswhat-to-build-part.html

For the BK Steve mentions that you don't have to use vintage parts except for the tube type. Especially for your first '29 transmitter don't get too hung up on getting all of the right period parts. Once you are into it, though, head over to the mecca of antique radio stuff in Bloomfield, NY, the Antique Wireless Association Museum. The AWA has a convention every fall. While I've never been able to attend, all sorts of parts must show up at the swapmeet.

73,
Niel - W0VLZ

Tnx Mike, for your interesting email and your pix of the beautiful rcvr....kudos to you. The pix give be a bit of encouragement. If you have the time, I'd also be interested in how it works..ie, sensitivity, cw selectivity, etc. I have read a few articles on the Reinartz rcvr that lead me to believe it covered 200m and up into the BC band. I'd be interested in the your wave length coverage. Agn, congrats on a fine example of homebrewing at its best. 73 de Bill K4JYS ----- Original Message ----- From: "'Michael A. Bittner' mmab@... 9954. Re: Homebrew and Old Time Equipment Party

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-11-17 00:34:54 UTC
From: JAMES HANLON
Topic: 9954 Message: 9954

I didn't see the original post, probably because there are two recent "Digests" of the AWA Group postings missing from my inbox.

But, if you are looking for a user friendly "contest" that caters to Homebrew and Old Time Equipment, be sure to check out the Classic Exchange, http://www.classicexchange.org . The next CW edition of the CX runs on Sunday, January 18, from 1400 Z and goes to Monday, January 19 at 0800 Z, 9 am to 3 am EST. The late hour gives those of us in the West more time to have fun. There are suggested frequencies for all bands from 160 through 2 meters, and there is usually a lot of activity on 40 and 20 meters during the daylight hours and on 80 meters in the evening and night. There are even some CX operators in Japan who hang out on 15 meters. The AM/FM/SSB Phone section runs on Sunday, February 8, same hours and same bands. Note that the AM Phone CX will overlap with the AWA AM QSO Party which runs Sunday, February 8 until 2300Z, so there will be an opportunity to work AM stations then in both contests.

Part of the "score" for the CX is determined by the sum total of the ages of all of the transmitters and receivers you put on the air for three or more QSOs. Homebrew gear is counted as 25 years old unless it is actually older or its construction article is older. So all of our "1929" rigs will count as 85 years old in the 2015 CX. You can work the same station multiple times if either he or you switches one or more of the transmitters and receivers that he and you are using, so there is an opportunity for lots of QSOs during the contest. Equipment from any era is welcome, although obviously new gear is at a scoring disadvantage.

Y'all come and enjoy!

Jim, W8KGI

Yes, I have visited Steve's excellent site on the Hartley. His looks beautiful also! I am less than two hours drive from AWA HQ and even closer to the convention. I may try that for parts shopping this year. I have been looking for the parts to build this gem, as you know, that can be difficult. I keep looking!

9956. Re: [AWA Group] Spider-web Coil

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-11-17 01:31:29 UTC
From: Michael A. Bittner
Topic: 9942 Message: 9956

Thanks to all for your compliments on my Reinartz receiver. It tunes from 390 to 1670 kHz in three highly overlapping bands with the original Reinartz coil, and I have not made any other experimental coils (LX) to plug into the jacks J9,10 & 11 for HF coverage. I did not have the correct value variable capacitors for C1 and C2 (500 pF and 250 pF respectively), so I substituted 420 pF caps for both as shown on my schematic. In subsequent articles in QST, the positions of these two caps were reversed which makes more sense to me and might account for Reinartz's claim of coverage from 370 - 130 meters. With my 90-foot long wire antenna and 22.5 Volts B+, the earphone volume is so loud that I had to insert the small variable cap, shown in one of the photos in series with the antenna lead, as a volume control. When I get all the tap switches adjusted just right, I can tune up and down the BC band and get a steady series of tweets every 10 kHz, without having to readjust the regeneration controls. Stations are heard by tuning to zero beat. The 01A's run best with 4-Volts on the filaments. The circuit is completely free of fringe howl and there are no hand capacity effects except for the band switch (S2) which, once set, need not be touched again during operation.

The circuit appears to be a basic Hartley and the purpose of all the tap switches is baffling to me. It seems to me that the whole thing could have been done much more simply and I would enjoy seeing some serious discussion about the circuit from anyone who may know more about it.

Since I have been collecting radio parts for a very long time, at this point whenever I want to build something, I just go up to the attic and can usually find whatever I need. The only things I didn't have for this one were the tap switch points which I got from Playthings of Past. Are they still in business?

I am not currently on the air on HF, so will not be participating in the BK event. My main interest is in receivers of all kinds and have had several articles on them published in Electric Radio magazine (ermag.com).

73, Mike W6MAB

Please tell us more about the RX. Is it usable on the air? Frequency coverage? How long did it take you to locate all those FB parts? And on...

Plan to work the Kelley this year?

He (Gary Schneider) is still in business. He was running a notice that the business is for sale, but I don’t see that notice now.

Tap switch points are in the inventory list (under ‘Hardware’), but he indicates you should inquire about them.

GM all,
Yesterday at the JARSFEST , in Benson, NC, I found a couple of interesting keys. One a Bunnell , but the other one looks more interesting. See the attached pix. The base is 5" X 3 1/4" X 1/2" thick. I'm not sure just what the base is made from...don't think its marble, but maybe some type of composite material. It's a solid material with some weight...maybe it is some type of stone or marble?? (The Bunnell was homebrew-mounted to a piece of marble abt the same size.. it is heavier). The thing that makes me think it goes back into the teens or 20s is the contacts are 1/4" in dia ...for spark use? The only lettering I have found is on the bottom... the numbers '2250-?'...partly deleted due to grinding a channel f or a wire. That wire looks like it is cloth covered rubber insulated wire and hasn't been disturbed in years. It would appear to me that it is a manufactured key since the base has molded or machined cutouts for mounting the key.

Anyone have any idea about this key...looks old.
Thanks..73 de Bill K4JYS

Subject: [AWA Group] Hamfest find - A Key [3 Attachments]

GM all,
Yesterday at the JARSFEST, in Benson, NC, I found a couple of interesting keys.
One a Bunnell, but the other one looks more interesting. See the attached pix.
The base is 5" X 3 1/4" X 1/2" thick. I'm not sure just what the base is made
from...don't think its marble, but maybe some type of composite material. It's a
solid material with some weight...maybe it is some type of stone or marble??
(The Bunnell was homebrew-mounted to a piece of marble abt the same size..
it is heavier). The thing that makes me think it goes back into the teens or 20s
is the contacts are 1/4" in dia...for spark use? The only lettering I have found
is on the bottom...the numbers '2250-?'...partly deleted due to grinding a channel
for a wire. That wire looks like it is cloth covered rubber insulated wire and hasn't
been disturbed in years. It would appear to me that it is a manufactured key since
the base has molded or machined cutouts for mounting the key.

Anyone have any idea about this key...looks old.
Thanks..73 de Bill K4JYS

Fired up my regen and my bare essentials one tube cw rig tonite. Been awhile since either was lit but the regen even though it is on batteries sprang to life .. I had a 3555 rock in the Tx and it was open at that moment so I gave it shot. No joy but I will try tomorrow and Friday as well. I believe I will institute a new law. No rig rx or tx shall have more than one tube!

Don, that's AWESOME! Loop modulation, I presume?

Very sorry I missed it; I was hauling and stacking firewood. Had I heard
you I would have fired something up and jumped in. I was listening to
7290 AM until about 1:30PM or so, before I went outside.

Joe WA2PJP is a friend I talk to often and see at the NEARfest twice/year.

Hi I am ka2rrz. What got me interested in the group, It starts like this I found a one tube receiver on e-bay and thought that would look nice in the shack. I wasn't happy with there price. I started searching the web and found lots of info on this receiver. I started looking for a tube, caps, and parts. I have them all now for about $ 20.00 much better. I am having problems winding the wire on the pill bottle to please me, I will get it after awhile, and plan to put a small LED in the bottle to add to the looks. I have always stayed clear of tubes thinking about high voltage, I am learning the old ways and really enjoy it.

Hi Guys:
I have just finished annoying the relatives and have returned from SoCal.
From one friend I have rescued a Hallicrafters SX-100 and companion speaker
from a slow doom in a barn. It's dirty but otherwise in pretty good shape.
From an antique flea market in Carlsbad, CA I picked up a rack-mount FM
receiver that is only suitable for parts but has an unmarked Millen dial
assembly in fine condition (other than dusty). Looks like I will be busy
this winter!

Sorry also I didn't hear you Neil. I was concerned most about my inverted 40/80 vee. It hardly gets any use so I worry about corrosion. Obviously it is Ok.
The 50L6 transmitter doesn't have much stomp. My 45 TNT does get out especially well on the long wire down stairs but since I fractured my spine, going up and down stairs is still a big chore. As for tubes 45s are becoming one of my most favorite tubes. I need a I Love Triodes t shirt perhaps! As for Am TNT I will probably have it on 7290 + or - 5 after lunch today around 1.30 to 2 pm. EST. I have a pushpull dual 45 amp I built but it doesn't seem to be necessary.

0-800 mA DC is a bit on the high side to measure plate current of a vacuum-tube 10-20W DC input rig! It's an order of magnitude too high; a 0-50mA or 0-100mA meter would work out best, in most cases.

I have a 0-800 mA Weston 301 monitoring negative-lead plate supply current on my PDM AM transmitter running the legal limit.

Dec 6/7 and 13/14, starts 2300Z (6 pm EST) Saturday night and finishes 2300Z Sunday night both weekends. This year for the first time I'll be putting W2ICE/0 on the air. A special W2ICE QSL card will be issued for valid 1929 contacts with W2ICE. Send QSL card and SASE to Ed Gable at W2AN.

10000. Bruce Kelley 1929 QSO Party

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-11-22 02:18:42 UTC
From: Whitebear1122
Topic: 9996 Message: 10000

Here are the rules from the 1929 QSO. This is what is published in the AWA Journal and should be up on the AWA website. I hope to work all of you 29'ers in the QSO Party. This year Bruce Kelley's call sign W2ICE will be on the air for the first time since his passing. Try to work the special event station if you can. Special W2ICE QSL cards will be sent for valid 29 contacts. Send your QSL and SASE in care of Ed Gable at W2AN AWA headquarters. 73, Scott WA9WFA

The 2014 Bruce Kelley 1929 QSO Party and W2ICE Special Event Station

The Bruce Kelly 1929 QSO Party is a yearly AWA sponsored event where participants build their own transmitters using the designs, techniques, and tubes that were available in 1929 and earlier, and then put those classic transmitters on the air and try to contact as many other 1929 stations as possible. Since they use early designs, it is a cacophony of whooping, chirping, buzzing, clicking, drifting, swishing, swaying, warbling, and other interesting signals. This is what ham radio sounded like in 1929 and for two weekends in December its 1929 again on the ham bands.

This year for the first time we are activating Bruce Kelley’s W2ICE callsign as a 1929 SPECIAL EVENT STATION! W2ICE hasn’t been heard on the 1929 QSO Party since Bruce’s passing so this will be a real treat to hear and work the namesake station of this event! A special event QSL card will be available for valid contacts with W2ICE. QSL information will be posted on the AWA website. W2ICE is operating as a 1929 station and contacts count just like any other station. The 1929 QSO Party was started in the early 1990’s and championed for many years by Bruce Kelly W2ICE, an AWA co-founder. Prior to Bruce’s passing, he asked his close friend John Rollins W1FPZ to keep the 29 QSO Party going. John Rollins managed the QSO party for many years and renamed it the Bruce Kelly 1929 QSO Party in honor of Bruce. Ten years ago John Rollins asked me to manage the 29 QSO Party for him and Bruce, and to keep the event alive because it meant so much to both of them.

Dates and Times: First two weekends of December, Saturday Dec 6 through Sunday Dec 7, and Saturday Dec 13 through Sunday Dec 14. Starts at 2300Z (6:00 PM EST) Saturday night and finishes at 2300Z (6:00 PM EST) Sunday night, both weekends.

Objective: Contact as many 1929 stations as possible. Contact exchange consists of RST, Name, QTH (State such as ME or MN or NY), last two digits of the year of the transmitters design or publication (such as 29 or 27 or 23), type of transmitter (such as TNT or TGTP or MOPA or COLPITTS), and power input (such as 6W or 9W).

Rules: Transmitters must be 1929 or earlier types of self oscillators such as the Hartley, TNT, PP tuned grid tuned plate, MOPA, Colpitts, etc. No crystal oscillators. Tubes must have been available during or before 1929. Typical tubes often used are type 10, 45, 27, 211, 71A. Individual stations can be worked only once on each band over the course of two weekends. You can use any vintage or modern receiver that you wish. The event is open to all 1929 stations including non-AWA members and AWA members. You are encouraged to join the AWA and support 1929 radio!

Input Power: Transmitters are limited to a power INPUT of 10 watts or less. However, to help make East-West contacts, power may be increased to 20 watts INPUT between the hours of 0500Z (12 Midnight EST) and 1300Z (8 AM EST). Note this is INPUT power. Power input is calculated by multiplying PA plate voltage x total PA plate current. Example: my plate voltage is 300 volts dc, and plate current is 30 ma, so total input power is 300 x 0.030 = 9 watts input. Stations running more power than this are considered “modern” for this event and do not count.

Frequencies: The QSO Party typically operates between 1800 to 1810 Kcs, 3550 to 3580 Kcs , 7100 to 7125 Kcs, plus or minus depending on QRM. 40 meter activity is up significantly because it offers both night time AND daytime propagation! So when 80 shuts down Sunday morning, I hope to see you on 40m.

Logs: Please submit your log so we can see who you worked and acknowledge your effort! Either electronically email your log to Scott at HYPERLINK "mailto:wa9wfa@..." wa9wfa@... or mail via post office to: Scott Freeberg WA9WFA, 327 Wildwood Avenue, Saint Paul, MN 55110. Logs must be in the 1929 QSO Party log format otherwise it will be difficult to score you. An official 1929 log sheet will be available for download from the AWA website. Please do not email logs to any other email address except to the WA9WFA account. Because of email problems in the past, I will acknowledge receipt of all email logs. If you do not receive an acknowledgement within a couple weeks, better check with me to make sure I received it.

Scoring: Remember that contacts with modern or high power stations DO NOT COUNT. Only count legitimate 1929 contacts. If you are contacted by a modern station, be polite, mention the AWA QSO Party and point them to the webpage for more information, then move on, or QSO them if you wish. We will count contacts with W2AN, the AWA club station. Scoring is simple. Add up the number of legitimate 1929 QSO’s. Example: if you make 15 QSO’s on 80 meters,10 QSO’s on 40 meters, and 5 QSO’s on 160 meters, your final score is 30. All submitted logs will be scored and the results published in the AWA Journal. Please submit logs by January 15, 2015. 73, Scott WA9WFA

This is the key I asked some questions about some time back, regarding straightening the lever. Tried very hard. Using brass stock on two sides in a large wise as wood was too soft, but, while made some progress, did not make too much. After a while it became obvious that the problem was really during initial manufacture, and, the hollow dowel going through the center of the lever was not inserted perfectly perpendicular to the lever. So, not much could be done there. So, just cleaned it up. Here are the finished photos, and if you would like to compare it to the way I got it, look at ebay item number 141450857712 .

Thanks Barry, however, this may be a little too early for BK, unless I could use spark, HI. Besides, at this time I do not have anything else ready anyway. Maybe in a few years after I retire. 73 - Mike

Easy AM.
While I am somewhat obsessed with loop modulation I have played with other methods. (Cathode, screen suppressor etc) One was so called Simple grid modulator(which is not really what it is but that is OK.) from the Arrl book and it worked but seemed unnecessarily complicated to me for use on a simple transmitter. It violated Don's AM Rule which is "No Modulator shall contain more parts then the transmitter it is modulating." And so I played around with using a single triode to series modulate a transmitter in the B minus circuit. It actually works quite well. The first rig I used it on was my TNT which is now loop modulated. it worked well. However I was thinking about the Bare Essentials 50L6 transmitter I used the other night with Lou. Really I thought there was no real good reason that set up would not work on it as it is cahode keyed.. Today was the day. I dragged my wooden modulator with its 01A triode and my battery pack upstairs. Pulled the key out and plugged my contraption in the hole. gave my wife a RX set to 3555 with its antenna down (that is Ok in Canada. Phone down there although not a great idea) plugged in a carbon mic and instant readable AM. I have some phone band rocks so some real good night I will see if I can make a AM QSO. The circuit is very simple and will work on any cathode keyed rig including my ARC 5 stuff. Can be built in an hour or so .

So:

Did you take the photos?

Do you know its history?

How did you clean the brass? Did you lacquer the brass?

How did you de-oxidize the hard rubber knob?

The replacement switch knob came from where?

What did you use to clean or refinish the base?

Probable year(s) of manufacture?

Describe its "feel" please.

12 days until the Kelley. Think there is an award for the oldest key.

Lou

I found a 3736 crystal in my junk box and fired the rig up on it. Everything seems fine. I did some local testing with a receiver and a tape recorder. sounded pretty good. Now I need to try a real contact. I am fine with a SSB or CW reply since not everyone has AM. The carrier is easy to find as it has a distinct sound . After 9 PM EST seems good so long as the 3736 spot is open. Just need a quick contact and signal report.

Ok Lou,
How about 9pm EST , Freq 3736kcs. It is the same rig (bare essentials) we used last week BUT I have it on my homebrew series cathode modulator which sports a 01A triode and a carbon mic.. Never tried it on AM before. So if conditions are decent we know you can hear it and you know its sound. I will call CQ a few times.. If you hear me come back with whatever you have. Thank you for taking the time. I hope your carbon mic comes soon. The suspense is killing me.

I could hear you Lou. Wasn't the best band conditions but your signal was readable and clear. Maybe a 5x6. If you couldn't hear my carrier we were beat since it is the same radio and antenna as last week. Some other day perhaps it might come through.

Many thanks anyway for trying.

I was working on some of my rigs yesterday many of which are cathode keyed. So I started taking measurements by placing the Ammeter across the key terminals which turned it on and measured total b current. My 45 TNT has 8.037 watts input. if I understand the rules for BK that is too much? Perhaps it is time to build a TGTP and a more appropriate power supply, 80tube and all. I didn't measure the BE tx but will today.

Don,

The rules for the BK specify maximum 10W DC input (except between midnight and 6AM EST when you are allowed 20W input). So the TNT at 8.037 watts DC input is perfect. You must have some awfully precise volt/ammeters! ;-)

Could be. I didn't get that memo. Don't want to be illegal but it does work well. Since I use a long wire single feed, end fed it seemed pointless to have a coupling coil. I know of Hartleys with a windom fed similarly. I could feed through an appropriate cap . While we are here. I ran out of 45s . 2a3seemed to be a reasonable alternative and is easily found but is it on the pre 1929 list?

Don,

Please describe your antenna coupling scheme in detail or, better yet, post a schematic.

Is your TNT transmitter wiring like schematic fig. 704 on VE7SL's webpage at http://members.shaw.ca/ve7sl/tnt.html but minus L3?

Is your L1, the tank coil, B+ hot like the one in fig. 704?

Do you directly attach the antenna lead to your tank coil or it it connected through a fixed or variable capacitor? ie. do you have B+ on the antenna?

For your type 45 TNT what value of fig. 704 R2, the grid leak resistor, did you use?

Do you vary the tap point for best tone or maximum input power or maximum power into the antenna?

tnx es 73,

From: w0vlz@...
Topic: 10032 Message: 10032

I've continued to not be satisfied with the stability of my Hull Hartley. Even after a long warmup it will drift 150-200 cycles during an average QSO exchange, enough that I get comments that my tone is fine but I'm drifting. I'm not talking about chirp but base frequency drift over a 1 to 2 minute transmission. The B+ voltage and current is constant, I'm driving a dummy load and nothing is moving close to the transmitter. The Nov 1930 writeup on the Push-Pull TNT (https://www.prismnet.com/~nielw/tnt/tnt.htm https://www.prismnet.com/~nielw/tnt/tnt.htm) hints at single tube transmitter stability problems by commenting that the Push-Pull circuit is more stable. I've noticed it also. My P-P TNT drifts about 40 cycles while my Hartley drifts 150-200.

One solution I tried was baking my Hartley. Maybe RF is driving humidity out of the transmitter baseboard as I transmit. That would cause a frequency shift. I removed the dials and RF ampmeter from my Harley, preheated the oven to 170 degree, turned the oven off and popped in my Hull Hartley to bake. (https://www.prismnet.com/~nielw/1928Hartley/BakedHartley.jpg https://www.prismnet.com/~nielw/1928Hartley/BakedHartley.jpg). I repeated this three times and then rechecked stability. I found the base frequency had indeed shifted at least 10% indicating that humidity was driven out of the base board but, unfortunately, stability did not improve.

Has anyone checked their single tube Hartley or TNT stability while transmitting using a frequency meter that can show a 10Hz change?

Hi Niel...happy Thanksgiving.
I have been running my '29 Hartley on 40m for several days. I, too, have some drift. I haven't measured it, but I'd say a couple hundred cycles. I was first using a VT-25 and it drifted. Today I plugged in the 210 and it drifted also. And once and a while it jumped maybe 500 cycles, which it did not do last year. It seems that mine will drift to a point and then stop. If I get some time, maybe I will do a better check and see just which way it goes...down I think. I don't recall it being as bad on 80m. Otherwise, I'm getting pretty good reports...T8 with a little chirp...better on 80.

GL and let us know if you find the cause....73 de Bill K4JYS

Hi Niel,
Are you using any solid dielectric caps in the tank ckt?
My experience with such caps, in LC power oscillators, has yielded drift problems. I even tried multiple silvered mica caps in parallel, to split the RF current between several different caps, in an effort to reduce the heating, and thus reduce the drift. An improvement, but the amount of drift continued to be excessive. There is simply too much circulating RF tank current, and even the best solid dielectric caps produced drift due to the small but significant amount of loss in the solid dielectric, which shifts the dielectric constant, resulting in drift.
Replacing the solid caps with an air dielectric cap cured the problem.
Anything that causes a reduction in DC to RF plate conversion efficiency, such as excessive circuit losses, improper grid bias, non optimimal feedback level, as well as attempting to run the tube at excessive DC input can also cause drift issues.

I don't know for sure, but I doubt it. A TNT using PP45s published in a 1933 (or was it 34?) connected the antenna directly to the tank coil through a DC blocking cap, and that's the same method I've een using on my PP TNT.

Neil - I have not tried this but just a thought....while listening to the carrier, try to connect and then unconnect an extra 10pf across C2 (250pf), the capacitor across the grid leak. If the extra 10pf is shifting anything at all then perhaps C2 is heating and changing value...

My TNT is pretty straight forward. Nothing special. The problem arose when I was using it on the single wire end fed longwire. This antenna works at this QTH very well. in fact any of you who have worked me with Am it has been on this deal. I used to feed a Homebrew antenna tuner and then feed the single wire feed from there and ground the antenna tuner to the grounded water system. To many wires. I run a pair of Arc 5 here as well and the single wire just loved them. I was influenced by my Dad a radio design engineer who worked for GE, Collins and Pye. He told me to "Try everything you think of. " so I do. I tried drilling a hole in the centre of the main coil of the TNT , soldering a stiff lead in and hooking the antenna to it. Right away it liked it. In fact I worked Dave W2VW on Am with it the first time I tried it. Some of you know him I believe. I left the ant coil on for months but it never worked quite as good with it as the direct connection. Finally I removed it. Yes the coil has B+ . The rig is quite stable and doesn't drift unless I get my hands too close so I was happy with it. Recently I built a 6l6 TGTP single control (dual variable cap and two identical coils. It works pretty good although would do a bit better with one section adjustable even if only slightly. I had built it with an ant coil too but this week tried it the other way and it was very happy with that. Was in an AM group for a minute Mon with it and was told my call and that my signal did not have a lot of strength. I was more then happy he could copy me and understand me and thanked him and went on my way. I did not know that it was a questionable practice other then shock hazard perhaps for folks touching t which is in this case impossible however I light of that within 10 minutes of reading the warning I installed a fixed cap (.01) in each ant lead between coil take of and wire to the jack and tested them . It appeared not to hurt them so I am happy. Not interested in being illegal. Just interested in radio. Thanks for the info on the 2a3.

FWIW, I used "direct coupling" to feed a single wire fed windom, in my novice rig, circa 1957.
The output tank of my 6AQ5 oscillator was series fed, so I did use a DC blocking cap.
The tap point on the output tank coil, was experimentally adjusted for max feeder current, as determined by a pilot lamp that was temporarily installed in series with the feedline connection.
The info for this scheme was derived from an old handbook, borrowed from a library, IIRC--vintage or title long ago forgotten.
It worked fb, and I never received any unwanted correspondence, re harmonic radiation, etc.
The fact that the little xmtr operated at a DC input of only 7 wts probably helped, in this regard.
73 & happy holiday to all de Ron n4gjv

Well yes, How did you know?
I worked this morning more on the trying to improve its stability. I think I made some progress. I reworked the antenna feed as well and pushed it through a tuner which helps. Then I reworked my 6l6 rig making similar mods and changing the loop's position. I am very pleased with it although I have to watch my distance to the mic or it over modulates. I might put a pot in the circuit so I can prevent that. And then... I reworked my old ARRL style simple grid modulator as they call it ?????? and got it to function very well on my 50l6 (now 50c6) transmitter. I am going to quit for the day. Might be on later this afternoon. 7290 +or - and later tonite 3736 with the BE rig.

He was very patient. I was having trouble as it did not like the mod I made to the antenna circuit and so was misbehaving everytime I moved or wiggled. I was going to sign but he had me hang in for about 4 . Trying different volume of speaking into the mic speak farther away , now try closer ,etc. Then emailed me later. Very encouraging. And it was all very helpful as I was able to correct a lot of it afterwards now that I knew what was going on. I completely changed the ant output today using the central position but a coupling coil and the tuner. Seemed to really improve its manners at least from here. I now run the loop with the lamp installed as it seems to keep it in check that way. Can't wait till Lou gets his mic.. Should be a lot of fun!

I am going to try my 50L6 rig at 7 am EST this morning. I reworked one of my other cathode modulators and it give a lot more carrier power and deeper modulation. If any are around the carrier is quite distinctive and should be heard if conditions are decent at all. .The crystal I have is a 3736 so it should be near that if not right on. I grind many of my own crystals so sometimes a sneak by just a wee bit..
don
Other plan for today is to build a "orange crate" Hartley for a 1920s triode.

Subject: [AWA Group] Re: Homebrew and Old Time Equipment Party

I didn't see the original post, probably because there are two recent "Digests" of the AWA Group postings missing from my inbox.

But, if you are looking for a user friendly "contest" that caters to Homebrew and Old Time Equipment, be sure to check out the Classic Exchange, http://www.classicexchange.org . The next CW edition of the CX runs on Sunday, January 18, from 1400 Z and goes to Monday, January 19 at 0800 Z, 9 am to 3 am EST. The late hour gives those of us in the West more time to have fun. There are suggested frequencies for all bands from 160 through 2 meters, and there is usually a lot of activity on 40 and 20 meters during the daylight hours and on 80 meters in the evening and night. There are even some CX operators in Japan who hang out on 15 meters. The AM/FM/SSB Phone section runs on Sunday, February 8, same hours and same bands. Note that the AM Phone CX will overlap with the AWA AM QSO Party which runs Sunday, February 8 until 2300Z, so there will be an opportunity to work AM stations then in both contests.

Part of the "score" for the CX is determined by the sum total of the ages of all of the transmitters and receivers you put on the air for three or more QSOs. Homebrew gear is counted as 25 years old unless it is actually older or its construction article is older. So all of our "1929" rigs will count as 85 years old in the 2015 CX. You can work the same station multiple times if either he or you switches one or more of the transmitters and receivers that he and you are using, so there is an opportunity for lots of QSOs during the contest. Equipment from any era is welcome, although obviously new gear is at a scoring disadvantage.

Y'all come and enjoy!

Jim, W8KGI

Worked from the git go. Does 80M and 40M . Sounds not bad keying. Used the 01A because the heater control was an unknown quanity and I am protecting my 45s. Turned out to be a good call. The heater control doesn't work although it looks good. I will check it out tomorrow. About 1/2 the power of my 45 TNT. Key down 268 volts at 16 mils.
Had it on 3555 and then on 7111 where it still is.

Lou,

I saw the photos (looks like a great rig to put on the air) and that you worked VE7SL but what sort of power can it run? (input and output) and how does it sound? What are you using for a power supply and receiver?

Right now I'll probably be running my P-P TNT with 210s at about 3 watts https://www.prismnet.com/~nielw/tnt/tnt.htm out and KX3/SW5 for the receiver. The weak link will be my antenna. If the Reverse Beacon Network is any indication, I should cover the near by states OK but east/west coasts will be a challange.

73,
Niel - W0VLZ

Thanks all, I fixed it.(schematic) It is how I remember a Hartley I guess (. top to bottom , grid cathode ground) Although it doesn't have to be. I played with it this afternoon . I replaced the found choke which was a bit light with a homemade one and reworked the coil slightly. Got a good increase in current and seemed to show up in the antenna. Now drawing 24.6 mils. Didn't check the voltage but it is definitely stronger. In the process it became a duck (quack quack quack) but I can live with that. A stouter PS would help in that area. Called CQ on 3555 for 15 minutes, Heard someone there but they didn't comeback to me. Sounded like a similar styled rig. I am quite happy with the little gem. The notes, Mike are not real important. They basically point out that the circuit doesn't require exact values but will function with anything in the ball park. I used what I ad in old NOS or used stuff bt just to see if I was losing much I subbed in modern stuff of more exacting values. Difference was not noticeable even on meters so I am content on my original choices. Circuit is not unlike one presented in Radio News April 1927 except for antenna coil circuit. I used a set up that works with my long wire and I am comfy with. Seems to hold its freq well. Any drift is minor and less the some of my commercial rigs. I am going to leave the 01A in and maybe see if I can hunt down a 171A. I am protecting my 45 stash for my AM TNT. It doesn't take much to smoke them so I am going to leave them for the big rig. Hopefully someday I will get a contact.

Niel,
I run 300vdc/20ma on a C-301A (1924 tube) in a '24 Meissner for 160m. I also have run a UX-301A at around 200vdc in a '29 TNT. I don't know if this was a stretch but have read of as much as 1000...yep, one and three zeros...being used back in the day...think that was from a note in a '20s QST. They seem to be pretty tuff. Doubt I'll go much over 300v. So far, no pblms with any of my '01As.
73, Bill K4JYS

A grid-modulated oscillator*.

> Is it necessary the rig be xtal control, anyone?

Only if you want more AM than FM.

> Do not have the rest of the article.

Bummer.

*This was even done at (yikes!) VHF, in the '30s. I made a single-triode VHF transceiver, just for fun, from a mid-30s circuit using a type 76 tube. It's a grid-modulated oscillator in transmit and a self-quenched superregen in receive. Not practical to use on the air these days, though. I wrote it up in the AWA Journal a few years ago.

Like Bill I have seen folks running 1000 volts on an 01A. Not that I am going to and not that they were intended for that but more that they just happen to be able to stand it. I have run this one on this supply in the TNT as well in between 45s. 45s are the ones the die on me.
I think that type needs crystal control. I use cathode modulation a lot if I am not on the loop. I have three different systems . Two are mine, one is ARRL s The 1940 Radio Handbook has a lot on it. I use it on my ARC5s for instance and also my TNT occasionally. A lot of our FM difficulties comes from the transmitters themselves and not so much from the mod method. If you are honest with yourself you know you can not reach out and touch your transmitter when it is running without producing a whoop so holding a mic plugged into t has a similar effect unless you are very still. Also there is no control of modulation although I have tried that with an odd ball carbon mic and had some success. Too much of anything is too much.
Anyway. Enough of that. It works for me.
I would be up to try the Hartley tonite on CW , 80M or 40M.
Have I had it on phone yet? What do you think?
don
Heard you today Larry with the Timmer. Could only hear you both when on the beverage so didn't try.
Re the reverse beacon. It would be Dx for me from here. There are none in my area. Buffalo is the nearest.

It says Phone not carbon mic so I am betting it won't modulate enuf so you can hear it. You would need a couple of stages and it would be pointless to use the grid if that was so. I don't think the article is about modulation but is about how to add crystal control to an osc and the compensations in the value of C that must be made to get it to osc with the crystal installed. But give it a whirl. Nothing to lose but some time.

The 8" extension is nothing more than a 8" insulated shaft with a shaft coupling on one end and a knob on the other. I remove the knob from the TNT velvet vernier and put the extension in it's place.

Remember the tuning cap and vernier in this design is hot to B+. Using an uninsulated shaft would leave B+ hanging out there waiting for someone to have a nasty accident. Also, most verniers including the National type B (used on the SW3) arre unsafe on this transmitter. The little lever on the type B to control the amount of reduction is right next to the knob and would be hot to B+.

73,
Niel - W0VLZ

GM Niel,

<snip>

When operating I put an 8" extension on the TNT vernier. Solves the hand capacity problem. Like to see that. Photo?

Don, the 45 has an oxide-coated filament vs. thoriated tungsten for the 01A, and it's not as forgiving yo running the filament above or below spec. Make sure your filament voltage is as close to 2.5V as possible.

Yep, was on 7290 AM yesterday talking to Tim WA1HKR, Al W1VTP, and Steve W2XU.

So I have discovered. If you are lucky with a 45 you get one chance . The 01A doesn't care. In fact I read an article once on rejuvenating 01A by running them free at 40 volts for a while. Whether that is true or not I will never know! When I put the B+ to the 01a I am more then content with its output. I have a special PS for my vintage rigs with a heater rheo built in and filtered DC voltage . I need to build a specific 2.5 volt unit . A radios here are wire the same for their PS connection. I use 7AC tube socket wiring. And that includes my ARC 5s. I would like to make a vintage PS as well . I have several 80 tubes but transformers are not easy to find (yet)

Yep, I agree. On my T-368F I did everything possible to make it sound like it had broadcast audio, including using a ribbon mike. All of my other AM rigs stayed stock as they were. Especially the WWII gear that I used on AM. It just seems that if you are running a 400 watt carrier on AM, it should sound both strong and of good quality. 73 – Mike

Wow, only 30 years, HI. I started playing with ham radio around 1958, but, could not get my ticket till 1963 when I became a citizen. So, I have been active for over 51 years on the air. Who would have thought? Certainly not me looking back.

It is neat to get a tape. Back about 25 or more years ago I was on the air with my T-368F on 75, or maybe 160, now I am not sure, with KW1I and a station in AZ and another in the Midwest. I was running full 400 watts carrier on the T-368F. Then I switched over to my military BC-474 putting out a little over 2 watts. Dale was able to hear me, and one of the other guys could tell I was in there. At the time I was living in Manassas VA, just west of DC. Regardless, about a week later I get a cassette from an SWL in Wisconsin, who heard both rigs and taped it for me. That was a real treat. I still have the tape downstairs. Need to find a cassette player and listen to it again one of these days. 73 – Mike

Yes I know ,been at it over 30 years and I have no problem with what floats others boats. To each his own for sure. Got lucky, Dan recorded the QSO and just sent it to me. Lou,You mean put a loop on my new CW rig? I can rig one up I guess. Don't want it permanent though. The TNT is my main phone rig. I think I am gonna sell the heathkit stuff. Too many tubes doing not much!

I should have got mine earlier. I fought learning the code for many years then later in life realized, "Do you want your ham ticket? Then learn the code." Took all of about 6 weeks of hard work and I got it. What is that old saying? "Zu bald alt und zu spaet weis". The rig sounded better then I would have thought. I couldn't detect a chirp but maybe I am just going deaf. I was nice of him to record it . I am sure you were thrilled to hear yours too. I have a BC454 rx and two ARC5 txs on AM (cathode modulated.) Not real strong but can be heard in good conditions.

This morning I was calling CQ on my tri-tet starting on 10M, then 15M, then 20M (hopefully not all at the same time!) with a 7010 KHz rock. No answers. I was working into my three-element tribander with the reflector broken by the Thanksgiving eve snowstorm.

No answers; checked the reverse-beacon network, nada.

Then just now I get an email from a guy (K1DW) in Louisiana saying he tried to answer me on 15M but I didn't respond. I definitely was listening to my frequency (at least the intended one, see above) but I didn't hear him. Was using my R-390A rcvr; no problem hearing on that one. On each band I checked my frequency with a counter, so I know I was tuned up on the correct harmonic.

When I'm using the "crude" rigs I'm going to start making notes of when I call CQ and on what band, so if this happens again, I can check if someone tried responding to a harmonic.

10135. TNT 80m loading - finally

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-04 13:37:18 UTC
From: N1BUG
Topic: 10135 Message: 10135

Subtitle: BUG make little discovery ;-)

Ever since I built the TNT, I've had issues getting it to load up well on 80. Using the standard 6 turn copper tubing antenna coil, it would never go above 25 or 30 mils at maximum coupling... even with lots of voltage on the plate. Partly it is my antenna (despite the fact I use a variable condenser in series with the coil), as it does slightly better into a perfect 50 ohm dummy load. But even into a pure 50 ohm resistive load, not nearly as well as it loads on 160 or 40. BTW, it is using a UX-210.

I don't know why this didn't occur to me before, but last night I decided to try the 160 antenna coil while operating on 80. It is 8 turns of #12 wire on a 3" diameter form, somewhat larger diameter and shorter length than the 6 turn copper tubing 80/40 antenna coil. It's perfect! The rig now loads on 80 like it does on the other bands, and does not need to be at maximum coupling to do it. Fringe benefit, too... one less item to change when QSYing between 160 & 80.

I was running it pretty hard last night, hence the not-so-pure note. I will, of course, be backing off considerably for the party in order to be rule compliant.

73,
Paul "Bugsy" N1BUG

Hi Paul,

So probably around 5uH? Your able to resonate on 1.8MHz with your 500pF cap? Or do you have a .001 padder on the variable?

So probably around 5uH? Your able to resonate on 1.8MHz with your 500pF cap? Or do you have a .001 padder on the variable?

Hi Steve,

I was referring to the antenna (link) coil. The 160 tank coil is 19 turns on a 3" diameter form, length 4.5". This resonates on 160 with the 500pf cap about 90% meshed.

Now that I think about it, I believe both of these coils are #10, not #12 as originally stated, but it shouldn't make any real difference.

To confuse things further, the cap in series with the antenna coil to aid in power transfer to 50 ohm antennas is 1000pf for 40, 80m. On 160 I switch a 1000pf fixed cap in parallel with it.

73,
Paul N1BUG

Of course. Sorry Paul. I should have guessed that. I think that's what I ended up with on my 160 ant. coupler also. Will check that tonight.

sounds great Dan...let me know...I'm all set up on 80m until tmrw afternoon
and then will reconfigure for a few hours of 40m activity.

Once again...and this is getting better and better every year...I would
politely beg for eastern stations to resist the temptation to move down to
80m at their sunset and hang-in for the west as there is still another hour
of sunlight here when the Party starts. 40m is always great here to the
east, between 7PM and 9PM EST, but usually all of the eastern stations have
left the band just as it's getting good.

I'm going to start on 40 and try to hang there until I have most of
the western contingent (or the ones I know about) worked. It's tough
deciding when to head down to 80. If we had all night it would be a
no-brainer, but by midnight most out here in the east have gone to
bed and there is no one to work on any band.

While most of you will be pounding brass in the BK I will be mostly listening although will jump in now ad then perhaps just to savour the experience. The band 80m was really quiet tonite. Meanwhile I had another clementine wooden crate saved and enough Masonite I built another chassis almost identical to the Hartley I built last Saturday. I painted it a let it dry meanwhile began collecting parts from my junk box and other projects that are no longer in use. I came up with a matched pair of nickel plated variable caps, Some old caps of what I think are appropriate values . I fabbed up a gridleak using one of them and a sanded down resistor nestled together. I had a plate RFC I made for an amp I no longer need . I wound the plate coil in large size for dominant Q and the grid coil much smaller but good. I have a nice 4 pin bakelite socket for the tube and I still have one spare tube so if it all comes together and it works It may be on air by evening. Is a free build, no schematic (yet, but perhps later) but I think it will work fine. We shall see. I will check the coils with the grid dipper and 100 pf fixed in the morning and adjust accordingly. I don't think I need anything more at this point so should be fun.

Last time (2012) I worked you at 2323z and the other "7 Steve" at
2329z. Easy! Solar activity is a bit higher this time, I think?, so
it may be a bit later before we get enough signal.

Unfortunately, we have a major ice storm moving in today. Fingers
crossed I don't lose my RX antennas!!!

I'm looking forward to working everyone over the next two weekends in the Bruce Kelley 1929 QSO Party!! I'll be operating as W2ICE/0, Bruce's call that is held by the AWA. If you make a valid 1929 QSO with W2ICE, you can submit your QSL and self addressed stamped envelope SASE to Ed Gable at W2AN and you will receive an original W2ICE QSL card in return. All logs go to me though like always.

I fired up the push-pull Colpitts this week and it's working "ok". This will be the last year with that transmitter as it's time for something new. The transmitter developed a jumpiness that I haven't been able to resolve. Sometimes it'll jump a couple hundred cycles for no apparent reason. It's either a marginal connection somewhere or a cap breaking down. So I wouldn't have your cw filters set too sharp with me or I might jump out of the bandpass. hi hi

It's been fun seeing the beautiful 1929 transmitters that you guys are building!

73, Scott WA9WFA/W2ICE/0 for the weekend

Listened most of the day and tried a few calls. Seems quieter then other years. I think propagation could be a factor. Anyway I got no replies 40M or 80M. In got the TGTP done . Just have to wire in the plug to connect it to my bench supply and a key jack or wires. Ran out of energy so I invoked The Cabbage Rule..
"Quit while you're a head." I am not entirely happy with the plate tank coils construction but it will do for testing I hope. The wire on it is a bit light as it was originally built for a receiver project. I don't have another 3 inch cardboard form so I may have to machine some schedule 40 ABS to look like period correct bakelite form and rewind it with hookup wire. Hopefully I will get a contact this weekend with one of my now three 1920s correct rigs. Some guys btw call CQ but never listen for a reply. I get about 3 letters of their call sent and I can hear them CQing again. I bet they don't realize they are doing it. Sometimes when you are up to your butt in alligators it is hard to remember you are there to drain the swamp. I have trouble anytime a I get a bit cranked. So I just mention it in case it might help improve someone's score. Going to fire up the real receiver (Regen) before I turn in. It can hear stuff the big rxs will never hear and I mean that. It makes my Kenwood seem deaf. I don't have a BK legal TX up here though so It will just be a listen.

Taking a break to stoke the wood stove which is keeping the shack nice and toasty on this chilly night.

I've been having fun working the 29 QSO Party as W2ICE/0. Just as a reminder, W2ICE was held by Bruce Kelley, one of the founders of the AWA and the 1929 QSO Party sometime around 1982. I managed to work N1BUG, VE3AWA, AA2YV, , N3GJ, from the North east , heard and called W1GIG several times, but haven't heard NE1S or other 1,2,3 landers yet. Been on 80m the whole evening but I'm just not hearing much from our New England friends. Hopefully I'll hear more in the morning on 80 or later on 40m.

Right now I'm faintly hearing VE7SL but just in the noise.

The 29 push pull Colpitts has been work pretty well. No one complains hi hi. I do have the morse code key taped to the chair arm to keeping the vibration down.

If you guys worked KC9WYV, he is a 12 year old boy working the 29 QSO Party at the QTH of Harold KB0ROB. That's why you haven't heard Harold on tonight. He's letting Joe work the event under his own call sign. That is very cool!

Great to work you in the BK again, Steve. Thanks for the kudos, but I think most of the operating skill was on your end! Nothing too special here - the 40M RX antenna is same as TX antenna = 2 half waves in phase (= half-wave dipole for 80M fed with open wire line and balanced tuner), and for RX I was using was an R390-A.
Tnx for your patience.

I got on 80M around 7:30AM local time, but only have been able to work N3GJ and W1ZB so far this AM. I heard W2AO calling AWA but he disappeared after I called him. Never made it to 80M last night; I slept pretty badly Friday night so was pretty wiped out last night - you were my last QSO of the evening.

QSL cards I have from the ‘20s show many stations running R.A.C. on the plates. So, between all the self-excited oscillator types running from all sorts of supplies, the airwaves in 1929 would have had everything from T1 to T9. I’m stunned by how good these small sets were. Think about it: on 40, that’s an oscillator running at 7 million CPS, and were asking it not to vary less than a couple hundred Hz with good tone using just a handful of parts! As a novice growing up in the ‘70s I would have thought it impossible.

Listening to the 80m and 40m AWA stations was an absolutely enjoyable experience. I had wanted to know what it was like to listen in on stations of that era. Last’s night performance could not have been better. Listening from FL, I had no trouble getting solid copy from many stations along the east coast up through Maine along with several VEs.

I have a modified Hartley but it’s xtal control. I would rather just keep it that way but it’s no good for the AWA contest. I have acquired about half the parts for a Hull Hartley and would like to wrap-up that project before next year’s event.

Well let's hope that condx are better next weekend as they were far from the usual early December delight, at least from this end. Conditions were poor enough that I didn't hear anyone in MN until the 5th hour! The Minnesota boys usually dominate the BK activity on this side as there are so many of them but last night it seemed that everything must have been going right over the top of their heads for several hours. Although signals were very fady and weak for the most part, propagation was long during brief lifts to the east.

All told I managed 29 contacts with some highlights being N1BUG Maine - on both bands, WA1JAS (40m - Maine and the loudest signal from back east), NE1S (40m - Maine), K4JYS (40m - NC), WB8APR (40m - MI), AA2YV 80m - NY), VE3AWA (80m - ON) and of course, the two best catches of the night...W2ICE/0 Scott running 'headquarters' duty and KC9WYV - 12 years young Joe and an absolute first-class CW op thanks to the mentoring of Rob, KB0ROB in MN.

Perhaps the 'wind god' believes he is helping to make my signals sound more '29-ish as once again, the BK Winds developed right on schedule, making all of Ross Hull's superb Hartley-genius sound poorer than even Lou would yearn for. I also noted a lot of AC-sounding notes, inluding my own...more than usual, and thought maybe a little auroral activity on some of the E-W paths may have been the cause, maybe not.

After seeing how my experimental type-10 amplifier performed when driven with the Hull Hartley during earlier tests this week, I am now very motivated to put a proper MOPA together for next yeaar...something all on one platform, as trying to mate two separate boards is an operational nightmare.

Hopefully there will be some new faces next weekend and more than ever on topband...it looks like the sun is getting very quiet once again so it should be nice. A nasty coronal hole stream blasting us last night was what put the damper on things.

ha! Most certainly the other-way 'round Larry. I felt guilty about asking for so many repeats and many would have thrown it in...thanks for not doing that! Your signal had plenty of strength but the chirp was really wide and along with the QSB made it a challenge! Thanks for staying up a little later than normal as well.

I had hoped to catch you on 80m in the morning but the band was just terrible. The furthest east I heard at 0400 my time was N8YE at about S1 and one of the MN boys, also weak. It was just not in the cards this weekend.

>I feel crystal controlled rigs should be allowed.

I agree Mike...there was a lot of movement toward crystals in the late 20's, especially after Jan 1, 1929...even more appropriate for a '29 contest. Of course, the crystal guys would have to do just what they did back then, scan the band for answers after CQing and it would be impossible for them to do any search and pounce. Maybe Bruce had it right after all ;-) ??

Steve –

I always thought that the 29 contest implied rigs ’29 or earlier. Also, I am not certain that Bruce came up with all those rules by himself. Regarding scanning the band for answers to a CQ, that is exactly what we had to do when we were Novices and were forced to use crystal controlled rigs. Especially if the other station was another Novice with a different crystal frequency. I remember doing that even after I had my General in 1963 on 15 CW where a lot of the foreign stations were crystal control only. Call CQ one place and tune the band for an answer. I would think back in the 20’s it would have been easier as the bands were not as crowded. I participated in the LC contest for many years, before it was even re-named in honor of Linc, and even there, one had to tune around for replies. As I recall when I was in it one had to use 1940 or earlier equipment. I see now it is up to 1950 or earlier. So, change to the rules are not out of the question if they make sense. Besides, you cannot tell me that with all of these free running rigs on does not have to tune around, HI. So, if one wants to be crystal controlled, it does not give him an advantage, but, it would be period correct. 73 – Mike

10186. BK From MN

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-07 19:21:25 UTC
From: Whitebear1122
Topic: 10162 Message: 10186

Wow I agree with Steve, conditions are horrible this weekend! Last night 80 meters was fair at best. I did work a couple west coasters, a couple east coasters, but I didn't hear the usual W1, W2, W3 crowd like in previous years. Seems like the band never went long. I did hear and call W1GIG several times with no luck. In years past I've listened as the East coasters start appearing on the horizon and then signals build and we work them for hours and hours. This year it was spotty at best. I heard N1BUG most of the later evening. I did work Steve VE7SL after 0500 when I shifted to high power, 20 watts input. Steve, I told you 10 watts but had just upped the power and was so darn used to sending "ten". hi hi I hope a lot of the guys are taking advantage of QRO after midnight Eastern time.

40 meters this afternoon is dead. I made two or three contacts and that's it. Even the main cw part of the band is quiet too. Maybe something will change the band might open up later this afternoon, otherwise we have to hope for better propagation next weekend.

If you guys hear me on 40m this afternoon, it's windy out and I've got a lot of wind modulation on the signal. Wonder what it sounds like from far away.

Agreed, the MOPA can be a nice stable transmitter since the oscillator can be driving at low power levels to maintain stability while letting the amplifier stage do it's thing without affect stability too much.

By the way, did you guys work KE0Z from South Dakota last night? First time South Dakota has been on the event. WIll had a great signal here with his Hartley.

Would love to work California some time.

40 is dead here this afternoon too. I am calling from time to time trying to drum up some business. I will probably switch to 80 as sunset approaches. I know I missed several easy ones there last night and am hoping to snag them before 2300z.

I will make some comments on conditions after it's over this evening.

Steve,

Would you mind elaborating on that statement? Why/how is it an operational nightmare? My plan has been for some time (more than two years) to build a UX-865 PA stage on a separate board. I have most of the parts. It's just a matter of getting motivated. It seems easy enough, but you make me wonder what I haven't yet discovered.

> It seems easy
> enough, but you make me wonder what I haven't yet discovered.

Paul - perhaps 'operational nightmare' may be a bit of overkill but my recent experience when trying to mate the new type-10 amplifier to the Hartley turned me to now favor the all-in-one approach.
I could see, just on the bench, that things would have to be very well designed to avoid unwanted coupling and keying can become a bit challenging should you want to key just one stage. This means separate filament supplies along with associated leads and a way of turning just the oscillator on while keying the PA, another set of leads...not to mention the ads associated with getting HV to both units. I was all gung-ho for the separate amp but a week on the bench has turned my thinking around. Perhaps others are making it work well but I suspect that most MOPAs were all-in-one unit for a good reason...just my thoughts.

Well, with the first half in the books...

It seemed conditions were below normal, especially to the far west. I managed to work VE7SL on 40 and 80 but Steve's signal wasn't as strong as he usually is. I worked KK7UV on 80, but never heard him on 40. I managed to work AB0CW in CO and KE0Z in SD. Other than that, MN was as far as I got and it didn't seem like I was hearing the full MN contingent.

I was very pleased to work our 12 year old op Joe, KC9WYV on both bands! The other notable highlight is having W2ICE/0 in the log on both bands. Thanks for activating the call Scott!

Thanks to everyone who stuck with me through some challenging QSOs, especially on 40. That band is a mess out here! Constant SSB QRM from Europe and South America make hearing anything a challenge after about 2100z, even with Beverages. Late this afternoon I had some S9 power line noise come up from the west and southwest. That added another layer of challenge.

The TNT was more growly than usual, but I was loading it a bit differently this year... trying to get a little better efficiency. I succeeded in getting about 40%, at the expense of my tone! It was more growly on 80 than on 40, and I think it tended to have more chirp on 80. Comments appreciated. On 80 I could put the key on the desk right beside the TNT with no apparent worsening of my signal. Not so on 40! Usually I have the key on a board which sits across the arms of my chair. After a while I get uncomfortable and put the board/key across my knees for a while... but in that position my sending is choppy (more than usual that is).

Considering propagation and noise issues, I am quite pleased with where I ended up for the first half. In fact I'm not sure who is left to work in the second half, so hopefully there will be lots of activity on 160 to add to the QSO count.

10194. W2ICE vs W2ICE/0 QSO Special Event QSL?

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-07 23:54:25 UTC
From: w0vlz@...
Topic: 10194 Message: 10194

Do QSOs with W2ICE/0 count and a "W2ICE" QSO for a special event QSL card?

Niel - W0VLZ

From this year's BK rules:

This year for the first time we are activating Bruce Kelley’s W2ICE

call sign as a 1929 SPECIAL EVENT STATION! W2ICE hasn’t been

heard on the 1929 QSO Party since Bruce’s passing so this will be a

real treat to hear and work the namesake station of this event! A special

event QSL card will be available for valid contacts with W2ICE QSL by
sending your card with an SASE to “Ed. Gabel, c/o The AWA Museum in,
PO BOX 421, Bloomfield NY 14469-0421.”

I think the no crystal control BK requirement puts a level of transmitter technology on the air that normally would not be seen. Most of us are familiar with crystal controlled rigs, not Hartleys or TNTs. If the BK allowed crystal controlled rigs it would start looking/sounding a lot like the LC but with older tubes.

The 10 watt limit on the other hand.....

Niel - W0VLZ

Yes and yes. W2ICE/0 is running legal 1929 so it counts, and contact qualifies for a special event QSL card. From what Ed told me, the QSL cards are original Bruce Kelley QSLs. Send your QSL to Ed Gable % W2AN at AWA Headquarters. Ed is handling the qsl cards and will process them once the event is over and I get the logs to him.

How 'bout a crystal-only QSO Party? Now that might be fun, especially if limited to one-tube oscillators only...80 / 40 / 20 (or higher with a tritet) and one specified times for each band :-)
No power limit...maybe someone will be brave enough to build that 813 tritet?

Niel...heard you briefly last night on 80 but with the crazy conditions, it didn't hold up for long...maybe next weekend.

On LC, I always used a VFO. Most of the time my transmitter was a Meissner Deluxe Signal Shifter. Not the most stable rig either, HI. For a receiver I mostly used an FB7X, but have used many others over the many years that I participated. Any ham who was able to pass a test, at least 25 or more years ago certainly should know what a Hartley or TNT or TPTG is, and, in my opinion, none are a challenge to build. I do remember Art Goodnow, W1DM (SK) who was a phenomenal engineer and craftsman. Even in the LC event, back in the day as they say, he had a crystal clear signal with no drift or chirp. His design was straightforward, but he paid a great attention to detail, and his early 1920’s vintage home brew rig sounded as good as any modern one. I am sure photos of the transmitter can be found in some back issues of the OTB. As I recall he used early WE tubes throughout. 73 – Mike

> “No power limit...maybe someone will be brave enough to build that 813 tritet?”
Then I’m ready now. This beast is in my collection. It uses a single 804 Radiotron in a power Tritet circuit. Crystal is a Bliley LD2. See p. 136 in the link below for all the details. Not quite the manly 813 but close.
http://www.americanradiohistory.com/Archive-Short-Wave-Television/30s/SW-TV-1936-07.pdf
However, I do have a dual 813 amp that runs only Class C with a modified form of the G2DAF “forward RF biasing” circuit. This prevents key clicks that are otherwise present in a Class C biasing system. The 804 + (2) 813 will easily produce 1KW given the excellent efficiency of the amp’s Class C PA.
http://www.g4dmp.co.uk/g2daf-lin.pdf
In the coming weeks, I’ll add photos of the 804 rig to my QRZ.com page.

Since I started this thread on a comment/ signal report I received by email I will tell you the rest of the story. I explained to the Ham who wrote me this was the BK weekend celebrating pre 1929 rigs and would be continued next weekend.
I explained what rig I was running and apologized if my rough signal had offended him. Late this afternoon he replied. Very encouraging. Said he was now a bit envious and wished he had logged me when he had the chance. (I wish he had too but didn't say that.) Anyway it was a nice conclusion to a potential issue. What was that German saying I used before ? ;>)

I agree. The fact that all rigs are self excited oscillators is what draws me to this event.

> The 10 watt limit on the other hand.....

I have mixed feelings on that. Anyone who knows me knows that I am not a QRP operator! I am a mainstream radio DXer/contester in the dog eat dog world of kilowatts. Three years ago, when I joined this fold, I was all gung ho on changing the rules to allow significantly more power. I've had three years to think about it, and have thought about it a LOT. I now favor keeping the power limit at 10 watts input. It is possible to build a low power fully '29 compliant rig that even looks the part for relatively little money. The cost escalates quickly for higher power levels, taking the possibility of building a competitive while still authentic appearing rig out of reach of many.

Bottom line: It is my opinion that whoever drafted the rules was a very wise man indeed. He knew how to make the event uniquely appealing and at the same time keep building a competitive rig that truly reflects 1929 within reach of the average man.

One could also point out that more power makes us more visible to other users of the bands. I heard a good amount of on-air complaining about BK signals this time...

> avoid unwanted coupling

Between coils, primarily? Or did you find other harmful coupling?

> keying can become a bit challenging
> should you want to key just one stage.

Indeed. Keying is a nightmare and probably the biggest reason I kept shoving the MOPA idea to the back of the project queue. Although I understand the advantages of letting the oscillator run and keying only the PA, that approach is not particularly desirable as it will have me scrambling to completely revise my station setup with respect to receiver and how to get some means of hearing my keying. I would prefer to key both stages or just the oscillator but haven't yet worked out the details of a suitable arrangement. It has been a while, but I seem to recall after reading a number of relevant (or not so much) articles I was still unsure how to do this.

> not to mention the ads
> associated with getting HV to both units.

My thought was to run completely separate power supply umbilicals to each board.

However, your comments have got me thinking about my proposed approach to the MOPA again. I have a couple more weeks of rush-rush trying to complete other projects and sweep/push/shovel/drag/muscle/haul/bulldoze them out of the way. :) After that perhaps I will revisit the MOPA idea, do some reading and breadboard something up to see what issues I run into!

Ramblings from my past thinking...

I had planned to place the PA board to the left of the TNT MO board, since the TNT output is on the left side.

For a time I had been all about making the cleanest signal possible, which in my feeble mind more or less translated to running the oscillator lightly. Hence the idea of assuring maximum efficiency of power transfer from MO to PA was born. I thought about keeping the TNT swinging antenna coil, running twisted pair from the TNT antenna connection to another link coupled to a PA grid coil which would have a variable condenser across it to resonate the grid circuit. I suspect this could be made rather efficient and allow for adjustable coupling. However I eventually scrapped the idea because it seems overly complicated and (primarily) because I couldn't find any 1920s examples of this approach. By now you know how I am. :) If I can't

find a 1920s example, it's not happening! This is purely a matter of personal choice.

My revised plan called for removing the TNT antenna coil and using a simple coupling condenser from the hot end of the TNT tank coil to the untuned PA grid. Most likely I would mount the condenser on the PA board and use a flying lead with clip to attach to the TNT tank.

In either case the PA plate tank coil would be a foot or more distant from the MO plate tank coil and could be placed at right angles to it if coil-to-coil coupling is an issue.

I am probably overlooking a number of nightmarish details.

I agree as well. It is not power that holds us back. I have learned that from signal reports. So I know the signal is getting out there. And signal strength reports are decent too. It is answerers that seem in short supply for whatever reason. Contests are not my thing anyway but fun days are. For rockbound rigs what is wrong with Straight Key nights.

Paul I have run a PA on my 45 TNT. I quit because I discovered I didn't really need it. It wasn;t power that was my problem. I was being heard . Some hams are cautious about answering a different sounding signal and won't. Others only talk to those they know well. Power won't help that. I am getting reports from 350 miles out . My DX60B with a dual 811A linear does little better. I had an opportunity a couple of months back to compare the TNT and the Dx60B with AMP on air (in phone mode too) The ham on the other end said believe it or not there was not a lot of difference on the S meter. Less then 2db. He was on the new England Coast . I am content with that. As long as I can get out and have a QSO I am happy. don

10210. BK Mid-point Obsevations

From: Bill Stewart
Topic: 10210 Message: 10210

GM All,
Boy, what a hoot. The BK is the high point of my operating and as usual
it was very high on the 'fun scale' too. Here are a few observations from
down south in NC:

1. I started out on 40m..Ted, W2VDX the first QSO. I made a few more
contacts than a similar time period from last year. Later went to 80m...yuk.
The band was very noisy. In general, during this first half, I gave out more
33T/44T reports than last year. I also received more of the same type reports
than last year. That proves an important point...we ole geezers can still hear
pretty good. I would agree with other comments...condx, in general were
not very good.

2. QSO high points:
Worked Steve, VE7SL on 40m...was tuff copying his wind-chime sigs...hi.
Hope we can work on 80 next w/e. Lou, VE3AWA had one of the sweetest
notes I heard...on 80 & 40m..and strong too..57 both bands. Also worked
Steve, KK7UV (MT); Will, KE0Z(SD); Joe, KC9WYV(MN)...great job
by a up and coming BKer...tnx to Harold, KB0ROB, who I snagged on 40m.
Tnx to Scott for putting W2ICE/0 on....got him on 40 & 80..and also for his
work keeping the BK going.

3. A Red-Face:
About ten min. before the end, a rice-box sounding station, W4NTO, called me.
Wanting to try for at least one more 80m BK QSO I asked him to QRX 'till six pm.
I gave another call for AWA stns...and he came back agn and I asked him if he
was running a '20s rig...yes he was Fritz said. He had the cleanest, perfect sounding
'29 Hartley I've ever heard. I then worked Jerry, W1ZB for the last BK QSO.

3. 40 Meter Behavior:
Seems this year I got more intentional QRM than ever...carriers during a QSO,
couple of times someone was sending Lid over and over. But, none of that caused
me to miss anything. The best policy is to ignore these idiots.

All-in-all, the first half QSO count was slightly less than last year. There were quite a
few of the usual participants I have not heard yet. That's it from here. Thanks to all
who put me in your logs....see ya next weekend.

I agree here, too. Helps keep it an even playing field, with operator
motivation, skill and ingenuity (and antenna, of course) being the
variables at play, more so than how much $$ you have to invest in
1929-compliant BIG TUBES.

Doing so will give the east coast another shot at 80m regional contacts. If its about scoring and fairness then the start stop should be more like 1700 when the low bands are all at their worst. But, I'm only in it for fun so it really doesn't matter that much to me.

I'm just in it for fun as well but it seems that by the time the band opens here many of the eastern stations are in bed on Saturday night and on Sunday the band is just opening as the postings of all the fabulous QSO's had over the weekend hit the net.

The other thing I was hoping is maybe a sked throughout the year for these 1929 stations not just the BK.

I'm not whining... no really I'm not.

> >Grammar's amp section of his mopa which you all were just discussing

> >I would chuck that circuit and free build it. Too much like an oscillator
> >and not enough like an amp

OK, thanks Don, but no need to 'chuck it'...Grammer's amp is a solidly engineered design and it performed beautfully on the one band I built it for. It neutralized easily and showed no signs of even wanting to oscillate.

I will likely reproduce his entire design but this time as all-in-one, as he intended originally.

Paul:

> >avoid unwanted coupling

>>Between coils, primarily? Or did you find other harmful coupling?

I can't say that I noticed any coupling between coils as the Hartley's coils were at right angles to the amplifier's. I used the same layout as shown by Hull in his Sept '28 QST
article, 'The Oscillator-Amplifier Transmitter'...I can send you a copy if needed. There were many wires and clip leads exchanged between the two units, not to mention power supply / filament stuff. I wound the PA tank coil for 80m and on that band it worked and sounded terrific. Now what I should have done was wind a dedicated 40m tank as well but instead, just clipped down the tank to resonate on 40m...same with the Hartley...I just used the 80m coil and tuned the oscillator down to 40. The 40m signal tone sounded awful...truly a RAC buzz to it. Not wanting to make a new tank coil and thinking that I had now 'seen enough' to know what I wanted to learn about the amp, I uncoupled and set up for the BK. I assumed, maybe incorrectly, that the buzzy tone was from stray coupling...RF maybe..or a combination of more than one type of unwanted coupling, hence my comment re coupling. I'm pretty sure the amp would work fine on 40m as well, with proper tank L/C values and proper attention to lead dress (short!)

> >keying can become a bit challenging

I would prefer to key both stages or just the oscillator but haven't yet worked out the details of a suitable arrangement. It has been a

while, but I seem to recall after reading a number of relevant (or not so much) articles I was still unsure how to do this.

I'm also begining to think that keying both stages would be simplest too. With the oscillator running at a much lower level, it should key fairly well even under load and certainly solves some design challenges. Beverly had a QST article describing the best way to key a MOPA and suggested this as the #2 choice. The #1 choice was keying the return lead of the amp tank coil at the cold-end (no RF) which was reported to work well...this was the first and only time I have seen that!

Maybe Steve (KK7UV) can comment as I'm not sure how he keys his MOPA.

> >not to mention the ads
> >associated with getting HV to both units.

>My thought was to run completely separate power supply umbilicals to each board.

yes...I'll have to do that as well since I can't run the entire MOPA from one supply very easily.

>>However, your comments have got me thinking about my proposed approach to the MOPA again. I have a couple more weeks of rush-rush trying to complete other projects and sweep/push/shovel/drag/muscle/haul/bulldoze them out of the way. :) After that perhaps I will revisit the MOPA idea, do some reading and breadboard something up to see what issues I run into!

I'm sure it can be done but I was running out of time and patience.

>>Ramblings from my past thinking...

>>My revised plan called for removing the TNT antenna coil and using a simple coupling condenser from the hot end of the TNT tank coil to the untuned PA grid. Most likely I would mount the condenser on the PA board and use a flying lead with clip to attach to the TNT tank.

exactly the way I did it...Sangamo on the PA board and a flying (short) lead from the Hartley's tank...tons of drive even with the Hartley throttled-down.

>I am probably overlooking a number of nightmarish details.

I hope you do this Paul...would love to see / hear the results....great comments BTW.

I think we're all in it just for fun - what other reason is there?

As far as "giving the east coasters another shot at 80M regional
contacts" goes, all of us east coasters pretty much work everyone there
is to work "regionally," by the time the contest closes as it is now.

This sounds like a great idea. Have a SKED page so '29 folks can get in touch with each other. Why limit it to one weekend per year?

I thought all ham operators in the 1920s scanned the bands for answers, regardless of oscillator type. Otherwise, you would think that the oscillators would have had some kind of fine-tuning device. Many are shown with plain dials and don't even have verniers.

Please correct me if I am wrong.

Jon

I agree Mike...there was a lot of movement toward crystals in the late 20's, especially after Jan 1, 1929...even more appropriate for a '29 contest. Of course, the crystal guys would have to do just what they did back then, scan the band for answers after CQing and it would be impossible for them to do any search and pounce. Maybe Bruce had it right after all ;-) ??

I use separate supplies on my MOPA. I key the oscillator only and leave the PA on but it is an 865 tetrode biased for *just* zero plate current with no oscillator drive.

Yes - email was down yesterday. The oscillator is a Hartley 45. Plenty of drive for the 865.

I think we're all in it just for fun - what other reason is there?

As far as "giving the east coasters another shot at 80M regional contacts" goes, all of us east coasters pretty much work everyone there is to work "regionally," by the time the contest closes as it is now.

Of course we're all in it for fun. It's just that we may have different definitions of fun. For some I'm sure fun is just getting on for a few leisurely contacts. Nothing wrong with that! For others the fun is an all-out effort to get the most QSOs. It would be harder on the mind and body for the latter type if the event went longer than 24 hours. I would classify myself as falling somewhere in between the two extremes. I am very motivated to get as many contacts as I can, but not enough to kill myself operating every hour of the event.

I'm not sure I totally understand the problem. As I see it, everyone gets the equivalent of one full night of operating. For some the night is split up a little.... part of one night and part of the next.

Would it serve the same objective to adjust the start and end time instead of adding more hours? Say start/stop mid-day instead of in the evening? Then everyone's full night would be contiguous. I'm not arguing against the proposal, just trying to understand it better.

I key the oscillator only and leave the PA on but it is an 865 tetrode biased for *just* zero plate current with no oscillator drive.

Let me see if I understand this. You're saying you leave all voltages on the PA even when receiving, so the PA itself requires nothing to be switched to before and after a transmission? I apologize for asking this. I think we discussed this once before, but I seem to have lost track of those emails.

Speaking from New Mexico in the Mountain Time Zone, I'd favor a couple hours extension in the time as well. It isn't about "winning" the contest - the folks back east have a much better chance at that regardless of what the time slot is just because the density of BK stations is much greater in the Northeast. It's about more time to have fun.

> Hull in his Sept '28 QST article, 'The Oscillator-Amplifier Transmitter'

Presumably I have access to the periodicals archive again. I will look for that article.

OK on your 80/40 meter experiences with the two board MO-PA. I'm still going to try that approach before doing an all-in-one for a couple of reasons. If it works I won't have to buy parts to build another oscillator. Theoretically or at least possibly I may be able to use the same PA with my Hartley, when (if?) I get to it.

> I'm also begining to think that keying both stages would be simplest too.

As of this point in time, I'm not sure how to do that. I need to find an article that discusses it and shows the circuit.

I'm thinking of maybe just keying the oscillator. Worst case the PA might require some bias switching arrangement. I suspect a combination of fixed and self bias may work well without switching, if just enough fixed bias is used to keep the tube cut off in the absence of RF excitation. I just need to do some research in order to make sure this is 1929 compliant.

> exactly the way I did it...Sangamo on the PA board and a flying (short) lead
> from the Hartley's tank...tons of drive even with the Hartley
> throttled-down.

My concern with this is how to throttle down the TNT. I can reduce plate voltage, but if the PA loads the oscillator too heavily, it still may not sound good. Perhaps tapping the coupling condenser further down the oscillator tank coil is the answer?

>you leave all voltages on the PA even when receiving.

Yes. I have a key with a shorting bar connected into the PA filament tap so I can turn off ('unkey') the PA for extended RX times or breaks. During frequent calling or QSOs however the PA stays on ('keyed') with the shorting bar. The PA is cutoff on standby (no osc. drive and no PA plate current) using an external bias supply. I tried keying the PA while the oscillator ran but I didn't like listening to my oscillator during RX times. I also tried keying both together but didn't like the signal quality.

Don,

Despite my earlier comment about not being a low power operator it's not more power that I'm chasing. It is a cleaner signal. I can get a pretty decent note out of the TNT if I run it at a watt or so output with 10 watts input (very lightly coupled to the antenna) but then I hear a lot of BK stations that don't hear me. That situation is not entirely compatible with my personality flaws. I work most everyone I can hear if I crank it up to 4+ watts out, keeping the input at 10 watts, but then it's real growly. I'm not afraid or ashamed to run it that way, but as a matter of pride and curiosity I would like to get that 4+ watts with the note of the lower power signal. I believe it should be possible with the MOPA design. Let the oscillator run light and the amplifier make the power. I guess it's kind of a "want to do it just because I can" kind of thing. My rig is a living room ornament and visitor conversation piece most of the time. It gets on the air for the BK and the occasional sked with someone from this group. Someday perhaps I will have enough space to keep it hooked up but for now that's not realistic.

Yes a lightly loaded osc sounds the best always. I have two Homebrew mopas currently but they are 1930s style not pre 29s. I leave the PA on most of the time . Larry (NE1S) gave me some hints on parking an amp and cathode resistors way back when and I learned to do it sometimes with an indicator lamp and a bit of bias in the neg lead so I could leave it on however it needs to be well behaved. In fact even my twin 811A homebrew linear for my DX60B and my ARC5s parks itself quietly and doesn't need switching. I am in a low density area for BK style stuff. Lou is probably the nearest to me (180miles atcf) that is active and he has done a sked with me several times to test some "different" stuff. That is such a big help it is hard to imagine. I built the twin 45 PA to use with the old TNT but didn't really get any better contact numbers so I robbed it last week for the new Hartley. I was working on quacking today with the new TGTP. It behaves as you described. Has good manners if not pushed too hard. However it has been running a day and still has no contacts. It is also harder to tune.

same as the TNT...the filament resistor center tap to ground...in this case, both of them tied together.

Topic: 10232 Message: 10232

Hi,

Please, what is the common value of grid leak resistance used for a 201A oscillator rig? Any rig circuit will do.

Tks, Lou

From my notes: I tried values between 5K and 100k when I had a 201A in my TNT. There was little difference within the 7K to 70K range, with perhaps (sometimes) a slight improvement in the note around 30-60K. I settled on 50K.

10238. MOPA Keying

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-09 22:41:16 UTC
From: JAMES HANLON
Topic: 10238 Message: 10238

As long as we're talking about how to key an MOPA, I thought I would share my technique.

I normally operate QSK, break-in, so for all of my "classic" gear I've built a differential keyer that does the following, in time-sequence.
1. My key closes. Then ...
2. A (mercury wetted) relay transfers the antenna from the receiver to the transmitter. At the same time another relay shorts the antenna input to the receiver to ground and connects an additional potentiometer in series with the RF Gain control of the receiver - adjustable for appropriate transmit volume.
3. After a short delay, an oscillator keying relay closes.
4. After an additional short delay, an amplifier keying relay closes.

5. When my key opens, the above relays release in reverse order. Namely ...
6. The amplifier keying relay opens.
7. After a short delay, the oscillator keying relay opens.
8. After an additional delay, the receiver cut-back relay opens and the antenna relay switches the antenna from the transmitter back to the receiver.

All of this happens quickly enough so that I can listen to what is happening on the air in between dots and dashes to well above 35 wpm, about as fast as I ever go.

For my MOPA, I use separate, 7.5 volt, center tapped filament transformers on both the 10 Hartley oscillator and the 10 amplifier stages. I key the oscillator filament center tap with my oscillator keying relay and the amplifier filament center tap with my amplifier keying relay. I have an SPDT switch that allows me to short either keying relay output to ground for spotting purposes. So if I put it into the "oscillator" position I can spot the oscillator without putting the amplifier on the air, and I can also run the oscillator continuously and just key the amplifier on the air if I please. If I put the switch into the "amplifier" position I can just key the oscillator on the air by itself and rely on the 45 volts of fixed bias I normally use on the amplifier to cut it back to a safe level. Normally I leave the spotting switch in its neutral (neither side shorted) position and run the MOPA in QSK mode, keying both the oscillator and amplifier in sequence.

I realize that not everyone would want to built a keyer this complex, but it does allow me to do some interesting things with my MOPA and it might give you a few ideas. I can supply additional information on the keyer for anyone who might be interested.

73,

Jim, W8KGI

I spent yesterday and some of today working on the TGTP 01A tubed rig. It appears to be working near as I can tell nearby. I solved some of its bad manners along the way. It is not easy to run. Anyway I have been banging away around 3550 to 3554 kc. Tuning is quite sharp. I don't know if that is good or bad. Set osc tuning then bring plate tuning in. They have to both be perfect to get a clean note. Have yet to make a contact but it is early in the program.

Check your email. I sent the crkt best I can remember. I think it is right. I didn't build it from a plan or schematic, just from how I know it works. The values for components I used were what I had on hand of vintage style stuff. The RFC (plate choke) I wound on a 1/2 inch dowel about 210 turns of #28 copper. Indicator lamp is a fetish of mine and is not necessary as you already would know. I just like them.

GM Don and All,

Thank you for the TPTG ckt. A few questions.

The lamp in the B+ line, is that a sub for a meter? What number lamp is it?

You are using DC on the filament, right?

What is the plate voltage?

Power in/out put?

See below ckt.

Tank coil: Gauge and number of turns pse?

You are prolific!

10251. Re: [AWA Group] TGTP reworked and running.

For some reason I can't see those photos.
Yes an indicator lamp in place of a meter for tuning. #40 bulb but now they are getting hard to find. Not using it will not affect anything in the circuit. I had already tried it both with and without as I believe "one good experiment beats 1000 expert opinions." With poorer eyesight I can tell easier with a lamp although I don't have any meters anyway. The tank coil? I would have to count. It was one I made for something else on a vintage style cardboard box from Micheals craft store and I used my Grid dip to check it and removed turns till it was in range for 80 meters. It is my intention to replace it with a 3 inch coil as soon as I can get to the shop and machine one on the lathe from Schedule 40 ABS.(I am healing from a fractured lumbar spine so am sensitive to any "pain" in that area.)
I like a 2 turn out loop for the antenna and probably 12 turns for the main coil in insulated hookup wire perhaps #18. Keydown voltage is currently 227 volts at 41 mils when tuned on freq.
Yes I run DC filtered on my filament. I want to try DC battery on them all as I have a hook up made up for it but haven't had the time yet to try it. I suspect it would be quite an improvement but that is at this point just a guess. 6 volt gel cells are available for the asking from Alarm companies who have to change them good or bad every year and pay to dispose of them. dropping them to 5v is of course easy. I use automotive heater control switches from CTC in all my early tube stuff to control heater voltage. They look right. Say HEAT on them and do the job not bad.

Don,

At the risk of sounding like "the schematic police," which is not my intent, I have a couple of suggestions:

(1) The .001 uF condenser between the RF "cold" end of the plate tank and the A+ terminal should be moved to between the plate/"top" of RFC and the tank circuit. This will put both the tank coil and the air variable across it at ground potential, instead of B+, with no other effect on the circuit. This is safer, obviously. Otherwise, there is no real need for the RFC and you could feed the B+ directly to the "bottom" (RF cold) end of the tank circuit directly (called "series feed"). The main reason for the RFC is to allow what was called "parallel feed" which takes the B+ off the plate tank circuit.

(2) The "bottom" ("Rf cold") side of the GRID tank circuit should be moved to the other side of the key. Right now you have "negative lead keying" which puts the entire B+ across the key when open. Also, your filament supply floats at full B+ when the key is open. Moving the connection will convert it to "cathode keying" which means the key contact and filament supply only need to float at the cutoff voltage for the tube, which, for an '01A, will be about 1/8 of the full B+ voltage (since the amplification factor of the '01A is specified as 8).

No doubt your circuit "works" fine, but the above suggestions are made in the spirit of safety and "good engineering practice." Whether you act on them, of course, is totally up to you.

73,
-Larry/NE1S

Ok #1 I understand. removes B+ from the tank circuit so only RF is present in the section and it is safer . #2 I am trying to understand better. If I understand I think you are saying feed the grid tank B- always (PS on) and key only the B- going to the one side of the filament. If that is so I hadn't thought of that before. Neat.
Is that correct or did I miss something?
Yeah it does work and not badly I think but I am up for any improvements. I didn't have a schematic I just whipped it up what I thought would work. I had to draw the Schematic when Lou asked me last night.
I have a similar rig 1930s style with a 6l6G I built when I was first recovering from my accident a few weeks back. Originally I gang tuned it but split it off last week to see if it would improve performance a bit and it did. It is an AM only rig. I could apply these output tank mods to it as well. Some good 40M day you may here a little squeak. This current rig is CW only and will stay that way.
thanks
don

>
Yep. So the "bottom" of the grid tank circuit (coil and air variable)
get connected directly to B-/ground, just like the "bottom" of the plate
tank circuit. The A+ filament lead still attaches to the key, which,
when closed, connects it to ground/B-. The effect is somewhat subtle and
a bit difficult to "see", but if you measure the voltage across the key
(key open, of course) you will observe a big difference between the two
ways of wiring it.

I would love to talk to you when you're using one of your Hbrew rigs.

Typically I have very low noise here, so it shouldn't take a huge signal for me to hear you.

Probably won't be on 7290 AM today or tomorrow; probably early Friday afternoon.

Thanks Larry I am going to do that now.
What I will do is monitor 40M which I almost always have on. I can tell from your signal level if it is a good day or not. When it is and there is a hole I give it a shot. I can usually hear Dirk and Rube fairly well. You just awe bit harder but sometimes it is quite good. (Like the other day when you and Tim were chatting.).
I have a question. It may be dumb so brace yourself, be gentle and hide your grin.. By isolating the tank output circuit(#1 correction) I make the output not DC hot however in my rig it isn't anyway because I have a two turn link out and no naked wires. Should I still do it or just next time?

Not a dumb question at all. As you say, the antenna and output link aren't hot with HV DC either way (unless the link touches the tank coil by mistake). But making the change I had suggested will take the HV off the tank coil AND the air variable, which, in my mind, is still worth doing, especially since it just involves the connections to just one component (the 0.001 uF cap).

OK, Got it.
I did correction #2 and have been trying it. Subtle differences , yes but somehow smoother. Thanks.
Measured potential across the key as you suggested, Only 41 volts. Unit tunes smoother as well for some reason. The duck has almost gone too. Hardly any quacking. I notice the heater dim slightly on keying . it did before too only more so. That is my next area to explore. I am really beginning to like this TGTP. I caution that with the fact I have yet to have a QSO with it but it is on par with the others if my instrumentation doesn't lie. I am pounding brass on or about 3550 when ever I am down there.

10259. BK contest changes

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-11 02:16:41 UTC
From: Ron Barlow
Topic: 10259 Message: 10259

Hello all,
I have been reading some of the mail, re proposed changes to the BK QSO party, and I wanted to add my $.02.
In my opinion, it "ain't broke", so please, let's not fix it!
IMHO, the distinctive sounding signals are a large part of what makes this particular event unique and interesting.
There are countless other operating events, including the Linc Cundall event, that provide an outlet for those that wish to use xtal control, QRO, intense competition, etc!
Coincidentally, the glowbugs group is planning to sponsor a February event (NRR)that would seem to cater to many of these whims---xtal control, more power, etc.
I understand that others may have different views. I just happen to find a large chunk of magic associated with spanning a distance of many 100s of miles, while using a xmtr that consists of a grand total of 6 junkbox parts, including an 85+ year old receiving type tube!
Ditto for the use of a simple regen rx.

The one proposed change that I do like, is the proposed extention beyond the current 2300Z end time. I believe that the potential for increased west coast participation would be a win/win situation. Perhaps an exclusion of some of the (mostly unused, AFAIK) night time hours would allow such a change to be more palatable, for those that would otherwise be inclined to resist such a change??

I was not QRV, in the BK, during the past weekend, due to the annual conflict with another activity (calender by Murphy!).
I do hope to be QRV next weekend. I hope to CU then!
73 & Gl to all,
Ron n4gjv

Ron and others that have commented...as a west-coaster I would also like to see the QSO Party ending time extended a bit...just a few more hours, say at 0200Z. This would give more contacts between east and west on 40m I'm sure as a lot of guys have left 40m for 80m just as it is getting dark and prop is improving. The eastern guys have been much more patient the last couple of years in staying on 40 even later than they would like but I still find it goes quiet here just as the band really settles in.

May I offer an alternative thought?

What about trying to encourage a late night 40 meter session for east coast to west coast? Maybe even write it into the rules somehow so as to get the word out and encourage participation.

I am all for increasing the number of QSOs for you guys out west. Maybe that would provide additional incentive for more stations getting active from out there... a win-win situation for all. It comes down to a question of what would be most effective in achieving the desired goal of more east-to-west QSOs.

I think a lot of guys would have a tough time taking advantage of the proposed time extension to work the west coast on 40, given that part of the evening is prime time on 80 for working the casual operators who are only on for a short time. I was still finding (and still missed) some "local" QSOs on 80 in the last hour of the second weekend, despite having spent a lot of time on that band. My point is that I think no matter how many evenings are available, a lot of guys are still going to leave 40 for 80 before the west coast gets good propagation. I find it very hard to stay on 40 with only one or two signals being heard when 80 is buzzing (no pun intended) with activity, much of it from stations who are not going to be there long. That part of the evening is also brutal on 40 here with QRM from off-continent SSB.

I am very interested in working the west coast on 40 but would find it far easier to commit to a late night (say 0500z-1000z) west coast "activity period" since the casual operators are gone and things are slow. I would think/hope a number of other serious party-goers would jump on this opportunity as well but who knows. It is true that the casual operators would not be participating, but I suspect it would be hard to convince them to expend the effort to get the west coast in any time frame.

I of course may be 180 degrees out of phase on this suggestion. Perhaps extending the time as proposed is the best solution. I merely offer this as food for thought.

I wouldn't have predicted much of a change in keying characteristics, but there could be some. I misspoke when I had said the effect of the change was subtle; what I meant was that it's not strikingly obvious why the difference in the two ways of connecting the grid return circuit makes such a large difference (anything but subtle) in the voltage present at the open key, unless one is pretty familiar with vacuum tube theory and circuit analysis. Basically, with the grid of the tube at DC ground, it is impossible for the cathode to float above the magnitude of the cutoff voltage for the tube. With the grid connected to the cathode, the tube looks like a resistor in series with the HV supply, from a DC perspective.

41 volts across the key is after the change, right? Before the change you should have seen the full HV supply voltage. Heater dimming on keying is not good - check for unwanted paths between your filament supply and the rest of the circuit. Your heater supply should be floating, i.e., no paths to ground besides the key itself.

Larry, life goes on and it is winter, worry not. Tomorrow is a bad word when you are looking after your stuff in winter. I am going to try all day anyway to see if I can raise any kind of reply. I like how this rig feels and maybe it all in my mind. The tuning changed because there actually is extra wire now (extended lead) in the grid tank . Minor perhaps but both dials just happen to read the same number on 3550kc . Just luck I know but I will take it. I think it keys easier because it is "ready to go " so to speak. Maybe not but it is nicer. I sure hope it is good on air because it is the best lookin radio I have! I will borrow the XYLs good camera and make a picture of the front. If it works on air I am going to rebuild my one tube regen to match add and an audio amp. Then I will have an all 01A station for 80M. Two TXs and one RX. That and a pair of round rim glasses and I will be "in the zone".

Favorable propagation for one. This time of year, minus major ionospheric disturbances, the hours of darkness and twilight are likely best.

An ordinary dipole at some reasonable height (40-50 feet), will put your signal on the whole continent and beyond, provided the entire antenna system is tuned properly and care is taken to minimize losses. What is your antenna setup? Do you know your actual output?

Steve, KK7UV

I use an single feed end fed long wire natural on 80M. No I do not know my output. I don't have a decent wattmeter. I would guess 3 watts on a good day. (6.5W input) I also have a 80/40 inverted Vee upstairs in studio A.
You talked about time what time does your 40m open up from the east? I am on the centre north shore of Lake Ontario in a place known as Prince Edward County. It is a island sort of. Hangs out in the Lake like a wart. I can work the east coast with ease even south east into VA and NC etc. Just never gave any serious thought about working VE7land with my Hartley, my TNT or my TGTP. I never gave a lot of thought to the time deal which since you mentioned it makes a lot of sense. The concept intrigues me. I will be listening around Sat to see what I can hear late at night.

Don,

"I use an single feed end fed long wire natural on 80M" Tell us more about your end fed long wire. How long is it? How high is it? What direction is it running in? Is it connected directly to the link output of your transmitter or is there an antenna matching network in between? Might make a big difference for you working VA and NC vs BC.

"I also have a 80/40 inverted Vee upstairs" Same sort of questions for this antenna.

One or the other might be a lot better for working the west coast.

FWIW I have an end fed wire on 80 broadside to the east but it is pretty low. It works fine around MN but DX for me last weekend at 10W in/2.5W out was only PA, about 700mi. I'm certain if I had it up higher it would do a much better job.

Niel - W0VLZ

10268. RE: [AWA Group] East coast West coast

Topic: 10264 Message: 10268

>don't have a decent wattmeter. I would guess 3 watts on a good day. (6.5W input). That would be exceptional for our self-excited oscillators on 40m where 25-30% efficiency is more the norm. Or is that a MOPA to which you're referring? A wattmeter would be a valuable addition to your station – both for adjusting your rig and for determining your output. On a Hartley for example, it is interesting to watch how output varies drastically as you vary the loading and the feedback tap.

what time does your 40m open up from the east? During the B-K Party, it is typically opening up at the 2300z start time and open throughout the night. It will begin it's fade around 1300z. I am several hundred miles inland (MT), so it may be a little later for those in the coastal areas.

I will be listening around Sat to see what I can hear late at night. I think many of us out west are on 40m until local darkness – which is around 0130-0200z for those most westerly like Steve and John (BC), Doug (CA), Dan (WA), Bud (OR).

Yes I agree but after 17 years of retirement and no pension it aint gonna happen unless Santa brings it. If I can't make it we don't get it. Well it was just a guess but I did work east and west over 300 mi ATCF and got decent RSTs so I must have some oomf. It is what it is anyway. I like it and it works well.
My longwire. Well. this QTH has been a difficult one. When I moved here I brought my A3 beam and never had a contact for almost a year. I sold it to a Russian contester as it had been a wonderful antenna at the old QTH. (About 200 yards up the road) I built a 20m vertical one day out of Copper and on the high bands never looked back. Can work the world barefoot with my TS830S almost at will conditions permitting. That prompted several experiments including an inverted L on 80M which is how I met Lou when we tested my Bare Essentials 50L6 rig a few years back. When I got into AM I wanted a dedicated shack and built one downstairs. I tried a few antennas with moderate success then one day decided to try the long wire end fed. I believe it is 137 ft long with a 67 ft single wire coming off about 4 inches in at a distinct right angle. I am going from memory and it has been awhile since I stuck it up but right from the first time I lit it it has been great. I got the dimensions from an old Frank Jones article if memory serves me and it works on 80 and 40 without a tuner just fine. If you have worked me on CW or AM except for the bare essentials rig then it has been on this antenna. It is up an "'average " of 40 feet I would say and goes from a tree by the house out over the cliff to a tree at the next fence. I have worked AM even into Maine and VA with modulating my TNT and had good signal strength reports. I had never played with end fed longwires but for this QTH this one has been a boon. I havean inverted Vee upstairs and use it for those rigs but truth be told the longwire puts it to shame. BTW I listen on a beverage both upstairs and downstairs except for my regen which doesn't need much antenna and does the job with a 10 inch 3 turn loop sitting in the window.

Sorry Niel I didn't answer all your questions. The longwire faces north south and is fed from the south end. The inverted Vee is fastened to the side of the house on a hydro insulator no longer used. The coax is almost a straight drop to the shack. It has 40M inner Vee and a 80M outer Vee. ends are about 6 feet off the ground for the 80m and a bit less for the 40s. It is built so there is minimum interaction between the two sections. I use iit mostly for my SSB rig when working the lower bands or for the Bare essentials rig. At the moment it has a 6l6g one tube AM rig stuck on it for testing. Leg lengths are normal dimensions and SWR is decent.

So what does it take to work the west coast from down east on 40M?

Not that much. As Steve said, favorable conditions of course. Many nights it is doable with a watt or two output and a dipole or similar at modest height. Last weekend notwithstanding, I have no trouble working the west coast on 40 with my TNT at 10 watts input (about 3 watts out) and coax fed inverted V, apex at 70 feet. My antenna may be higher than most but I'm sure I could do it with less height. Even with poor conditions last weekend I worked VE7SL at 2318z... while it was still light at his end. Signals would have undoubtedly been better later. I have easily worked Europe with the same setup.

It gets a bit tougher on 80 but still possible. I have worked VE7SL, KK7UV (both worked last weekend under poor conditions too) and others. Two years ago in the BK I worked WB2AWQ in Reno, Nevada on 80 near my sunrise. What is special about that is his antenna.... a dipole strung along the top of a wood fence, about 6 feet off the ground. He reported the fence was soaking wet at the time which probably made it even worse.

I have also worked the west coast and England on 160 with the TNT at 10 watts input, 3 or 4 watts out. My antenna was a bit better there though... a tall vertical with lots of radials on the ground.

I usually listen on Beverages because I have a lot of local noise sources near my transmit antennas. If I were in a less noisy environment, Beverages probably wouldn't be needed.

Generally the times are between sunset at the western end and sunrise at the eastern end (while the whole path is in darkness). On 40 you can extend that a bit, but not so likely on 80 or 160. There certainly can be exceptions but signals often peak around sunrise at the eastern end.

Paul - I think that would be interesting to try but often at this time of the year, 40m gets into it's midwinter funk and either goes very very long or just plain dead a few hours after sunset....checking my past logs I see that there are few QSO's after 0500Z on 80m, unless condx are really up and down. A couple of my 'must-do' QSO's with Lou have occured after 0500Z and it is usually after this that condx can get quite good...but most easterners have probably shut down. It may just be a no-win situation in the long run.

Last year I worked 17 stations on 40m between 2300 and 0128 Z over the two weekends so it may be just more of case of having better condx...if condx are good and easterners are working back west on 40m, they seem to hang around....if not, it's off to 80 and who can blame them!

Shall we decide on a time for everyone to gather round the 160m fire on Saturday night? Last year it looks like it was 0200Z - 0300Z and at the low end ~ 1805 +/- a few.

It's a little early back here but the time slot produced 8 contacts so if condx are normal, it seems to work....

...others??

Don - I will certainly keep an ear out for you on Saturday night on both bands or if you like, we could try a pre-arranged time and frequency? If condx are 'normal' just a few watts is all that is needed but this is assuming a fairly efficient antenna system on both ends and for rx as well.

The nice thing about RF is that it just loves to radiate so if condx are above normal, almost anything will work it seems. Last weekend was very poor...I never even heard Lou on 40m in spite of working several others back east and Lou has an efficient zepp / tuned feeders I believe and high enough, so bewteen here and VE3 is often just a little too short it seems!

Let me know if you would like to try a sked otherwise I'll be sure to keep a close ear for you.

Steve / 73

I hate to muddle in your contest time. I am not that good an operator on CW anymore. I tend to panic when I hear my call.(get that "Are u talkin to me ?" feeling.) I am usually up then and will give a listen on 40M. If there is a lull I might give it a shot. Thanks for the offer though. I have three rigs 45 TNT, 01A Hartley and an 01A TGTP (which has quite a quack if pushed.) I must admit I find the idea most interesting. I am building another PS so I can operate the old rigs upstairs as well. I have toured your site many times over the last few years and enjoyed it very much.

0200-0300 sounds OK to me.

I note that in 2012 my log shows 160m contacts 0057z-0244z so seems there was activity for about two hours at least.

> Paul - I think that would be interesting to try but often at this time of
> the year, 40m gets into it's midwinter funk and either goes very very long
> or just plain dead a few hours after sunset....

Steve - You bring up a good point. I wouldn't expect that this year (noting of course that we are at different latitudes and possibly in different propagation realities) but certainly during the years near solar minimum that would become an issue. One which I had failed to take into account!

> checking my past logs I see
> that there are few QSO's after 0500Z on 80m

Same here. At least out here in the east everyone has gone to bed! Again during solar minimum there may be propagation issues at work, but for the last couple of years stations have been loud right up until they just stopped for lack of QSOs. The casual guys are long gone and the diehards have worked each other. I usually pull the plug myself about 0500 or a bit later because everyone else has.

Perhaps there are no easy answers. I find it very difficult to decide what band to be on at what time for this event, mainly due to the relatively large number of "short time" stations which make up a significant percentage of my QSO count *if* I'm lucky with my decisions.

Well, here it is.

I will definitely be on 160 during the proposed 0200z-0300z window.
Otherwise 2300z-0530z wherever the activity seems to be.

0530-0600z and later if any luck I will make as much noise as BK
rules allow on 40 and see if anything happens. It's an experiment.

I will be on 80 for at least an hour prior to 1200z sunrise.... 40
during the day Sunday, finishing up the last couple of hours on 80.

Good luck to all!

I happily note I finally broke down and spent some $$ on a display
case for the antenna coupler, so after this weekend's activity it
won't have to hide in its plastic bag any more. As I've said
before... DUST... is... EVIL. :-)

Hi,

Lots of good suggestions regarding Party improvements...except for XTAL control. Helps us! Anyway...

Looking for an answer based on experience.

TPTG ckt with tested, very good UX-201A.

120V B+ 5V DC filament.

Grid leak resistance value set for maximum efficiency. I.e, max. output at minimum Ip, tone quality and keying.

Fully loaded to a 50 ohm dummy load.

What would be the expected Output?

I appreciate there a variables, but assume all factors set to maximum.

Tks, Lou

BTW, back in the late 70's early 80's I used to visit Warminster PA on business fairly often. At the time I tried to visit other hams whom I have known through AWA. On one visit I went to see Bill Hurni, W3HWT, and at the time he showed me his rigs that he crafted for the 29 activity. At the time I thought it was neat, but, it was not for me. I was more interested in original equipment and not replicated ones.

Bruce also visited me several times at my house in VA, as he was in the area often as he had a daughter nearby. Whenever the subject of the on the air AWA activity came up, he was always more enthused about the '41 activity and never even mentioned the '29 one. 73 - Mike

> wasn't direct-coupling made illegal in 1929?

I was reading some early QSTs tonight and came across this note:

"Effective January 5, 1925 - Amateur stations must use circuits loosley coupled to the radiating system, or devices that will produce equivalent effects to minimize key impacts, harmonics and plate supply modulations, except in cases where loops are used as radiators. Conductive coupling, even though loose, will not be permitted."

I gather that they got around this by using tuned LC tanks to cover the "or devices ..." part of the rule? Not sure what the last sentence means actually...is a variable cap a 'loose' conductive coupling device?

Steve

Hi, Lou and Steve...

Everything seems to be working OK. Good 1929 note and good output for a 245. Will use GPR-90 and FT-817ND for receive and probably stick to 80. Lou, please let me know if you want to run a test before tomorrow night. Cheers, 73 and “Good luck in the contest!”

Harry, VE3GRO

Another VE! So how many of us maple syrup sucking hams are there in this group? Well that's good. I checked out the instructions for BK and wrote them out. They are hanging in front of my tuner. I may give it a shot.
Output. I am a light bulber for testing. I know, your brothers cousin in Denver worked four states and Europe on a 100watt bulb with a 6l6 transmitter, which BTW is utter nonsense. I find in the shack the meters don't know the difference between stray RF and proper signal. the light bulb does and it has helped me several times sort out a project transmitter that the meters were lying to me about. I keep a 100 watter mounted on the wall with a spare 60 watt bulb , a 15 watt bulb, a 7 watt bulb and a 4 watt bulb. My 4 has gone missing so this morning I am going to restock at Lowes then I will have some idea or measure of comparison for these last two rigs I built the last two weekends. I am also big on sniffer lamps and have a few in the shack.
I have had good success with the TGTP rig yesterday. I wasn't happy with its output so remade the plate tank and output link. Got a huge improvement. I will have it on 80M tonite for the BK. If it goes reasonable I'll stick with it. Perhaps using all three rigs during the night. Prop prediction for this evening is "GOOD"

"Always do good work."
?Something I always strive for...

Ha!!! I think I hurt myself laughing... TNX Lou.
No idea on your question. The unknown to me seems to be how heavily you can load thing, hence how much plate current can you get it to draw. My 201A's weren't very lively until I got up around 300V.

73,
Paul

Lou, this is highly un-scientific.
On my 160m '24 Meissner, I use a C-301A with 300vdc at abt 20ma...+/- 6 watts input. It lights a #47 lamp to what looks like abt full brilliance going into the Inv. L, which is fed
with coax. Hope you can copy it tonite on TB.
73, Bill K4JYS

OK... No watts out suggestions. Maybe I was too circuit specific. How about this? Output of any rig using a 201A? I know ur out there...

In the 1930s, "Boys Book of Wireless" I have, the last sentence of the last paragraph reads, "Always do good work."

Something I always strive for...

Lou,
Have been running the same tube with those values for several years
on CW. It doesn't get hot...maybe just warm. I think many '01As will take a
lot more abuse than we think. However, around 300vdc is my personal
limit...hi. Oh, I also ran a CX-301A in the '29 TNT for several years
using around 200vdc and 15-20ma. So far...no problems...Bill

I have run my 01A many times in place of my 45s. (A few years a least off and on)They seem to take anything you ask without a whimper. I currently run key up voltage of 300V. Pulls to the 220 range key down and 20 to 26 mils . (Looping does not change that BTW.) This morning I bought some 4 watt clear bulbs at Home depot. Since I use clip on antenna and ground hook ups on all my 20s rigs I soldered a set of clips to one bulb and clipped it in in dummy load mode. Looks like about 2.5 watts for the Hartley and a bit more , perhaps 2.6 watts for the TGTP. I used the same tube in both to get a fair test. They were both tested on the same power supply. The TGTP is tricky to tune. I need to mark it or keep records of the dial positions. The clip on 4watt load turned out to be real handy as I was able to sort out another 1930s rig I built that I was not sure of. About conductive coupling Steve was talking about. I think the iffy coupling not specifically mentioned was through a lamp bulb like Bill is doing but direct through , not through a link or cap. Also was thinking. That was QST. May not have had anything to do with us here in VE land.

For sure Don...that 'rule' only applied to U.S. amateurs but I've got the feeling that Canadian hams, following the events / info in QST, pretty much played along with the U.S. when it came to ham radio.

We need to find a few old guys that were operating in 1929 and ask them.....they should just be pushing one hundred now...maybe not such a good plan.

Thanks . I am not good at this as I get a bit rattled. You are my all time DX for any of my 20s rigs at 432miles ATCF. Surprised me as I am just above 5 watts input. This was the first night for actual QSO with the new TGTP. Trial by fire but she did ok. Your signal was coming up towards the end of our QSO. Got three logged tonite. Two on the new TGTP and one just now on the Hartley. Didn't fire the TNT 45 unit tonite as it is a 40m rig and as much as I wanted to try it I went up on 40m and listened around but heard absolutely nothing. Missed a couple on 80m too (NE1S an VE3GRO) but there is always tomorrow.
Thanks again. I enjoyed it.

We have a scheduled power outage here for line maintenance so I am dead in he water for an hour or so. I fired up the regen which is always on battery power. There was Larry (NE1S) banging away and Harry(VE3GRO) in my headphones. This is how it would have been back in the day. This regen is a 6sn7 twinplex so isn't 1920s but I do have downstairs a 1 tube regen I made a few years back for 80M that uses an 01Aor equivalent. Unfortunately I don't have a bushel full. Just two and one is almost beat. I think for next year I want a whole battery powered station. Been thinking about some 26 tubes which have 1.5 heaters so if any have too many I can help. I do have a stand alone battery PS that runs from 6 or twelve made from an old radio vibrator supply. I may try running one of the rigs on it now just to see how it does. BTW sig to noise with no power in the house or in the powerlines and a regen is absolutely incredible.

Good Morning All,

Well, another Sunday morning, another "...almost-ready-to-end-for-the-year" BK affair...

I must say, I've been thoroughly enjoying reading all of the posts that have sprung up here, to the point that they served to inspire me to design a new QSL card for myself (see below), as I've run out of the old ones here.

As I was telling Lou before, I had serious good intentions of lashing together some sort of a multi-band dipole affair here, & surprising the gang this weekend with a few melodious "CQ AWA DE VE3CUI K" calls on the air...unfortunately, each & every day of the week brought with it some new & varied non-Ham radio related challenges---everything from doctor visits, to house-sitting for my son, to---and this was the real clincher, believe me!---being told by our dealer that he wants a "mere" $3,200.00 to repair our SUV...!!!

It was all MORE than a tad "overwhelming," & left me scratching my head as to how I ever managed to work full time, address similar such issues, and prep for prior BK affairs, and all at the same time, too...! (and they call Clark Kent "Superman"...!!!).

Anyway, guys, hopefully things will be different here in 2015---and the contraption that you see gracing the front of my new QSL card will be the exact same "ears" that I shall be using to copy YOUR chirpers, buzzers, drifters, wheezers, & gaspers, "...a la 1929."

~73!~ de Eddy VE3CUI - VE3XZ

Read your post Ed, feel you pain. I now make fun my priority BTW. Trouble has to take a back seat. Its been up front far too long!
I went downstairs found the vibrator supply and hooked it up with a fresh gel cell in the box. I forgot , metal automotive radios have common A and B voltage grounded in the unit so when the power is on as soon as the tube warms up I was on air. Thinking quickly I grabbed my carbon mike and popped the modulator module in the tank coil. I did a dit dit dit dah dit dit dit dit dah dah dit dah dit dit dah dit dah dah dah dit dit dah into the mic to keep it all legal and then killed it. Vib supply has no trouble powering it though. I may unfloat the ground for the B- or make a whole new unit after a trip to the wreckers for a spare old radio. Or I can just put an outboard battery for the heaters which would be quick and cheap like me (I used to be quick , now I am just cheap). I like the sound of the vib supply. Adds to the experience. I also have a 24V/110 dynamotor MMMMMMMMMMMMM?

Reworked the battery powered PS and fired up the vib supply. Wired in a separate heater battery independent. Works great BUT 316 volts key down even if only 17.6 mils. Not a huge difference in power out. Tone is better and less whoop so I plugged the set back into shore(house) power. I sent a test VVV and Paul was on me like dirt with my call so we did a 40m as well. How did he know it was me? Maybe I IDed and didn't realize it. I was on the new Hartley, the one I built two Saturdays ago which tunes both 80m and 40M so I worked N1BUG two different bands two different days with two different rigs. Just for fun I switched on the 45 TNT and moved down the band so not to bother Paul and fired off a volley. Got the same fellow I worked last last night after I worked Paul. So he also worked me two different bands two different rigs two different days. All in all I had fun. got to use all three rigs successfully. I figured I was done building then someone here said the word colpitts. I don't have one -----yet. Anyway thanks to those who encouraged me and worked me. twas fun!

10329. BK 2014 de BUG

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-14 23:00:12 UTC
From: N1BUG
Topic: 10329 Message: 10329

Well, gentlemen, my second BK is over. Thank you all for the QSOs and fun!

This weekend was a struggle. I scratched and clawed a lot but came up with relatively few QSOs. Oh well. Nature of the game.

Highlights:
Working W2ICE/0.
Finally getting VE3LYX in my log.
Working N4GJV who is responsible for getting me into this.

Other comments:
It was nice to work a number of VE stations - VE3AWA, VE3LYX, VE3GRO, VE7SL, VE7BDQ. Sadly I never heard VE3BHK if he was on. Eddy, VE3CUI/VE3XZ was sorely missed. I do hope he will be able to join us next time. Hey guys, recruit some VE1/VE9/VE2 folks into the fold.

Lou has a lot of patience. Thanks, OM! I struggled with him on 160, asking for many repeats. His tone blended almost perfectly into my power line noise. I had to get the receiver just so to hear him, and then when his rig shifted slightly it was no more Lou, had to go hunt for that just right sweet spot again. While doing so I would miss things. Once I got him tuned just so again, copy was OK.

Conditions seemed poor both weekends. The only western station worked on 40 was VE7SL. Nothing past MN on 160. 80 was a little better with VE7SL, AB0CW, KK7UV, and VE7BDQ making it into the log. I was surprised to hear VE7BDQ call me last night.

Activity on 160 seemed well below 2012 levels, but maybe it was just due to very poor conditions. I hope so. I would hate to think people are giving up on my favorite band! In a few years, when we approach the next solar minimum, 160 will really come into its own.

Thanks to WA3MEJ (non-AWA, a friend from DXing activities) for the sound clip of my signal on 160, and NF1O for the 80 and 40 meter clips. I will post them on my web site soon.

Bugsy, please install lower value bleeder on power supply. It takes too long to bleed down. I flinch every time you use a screwdriver to discharge the condenser in a rush to change bands. -Paul

Oh, great. Now I'm talking to myself in public. See what this OT radio stuff has done to me? Those who knew me before I got into this: Shhhh!

T minus 355 days, 23 hours, 59 minutes, 59 seconds and counting... I thought I had it bad! ☺

Lou has a lot of patience. Thanks, OM! I struggled with him on 160, asking for many repeats. His tone blended almost perfectly into my power line noise. I assumed that the problem was just that my sig was weak. Next year I'll run DC on all filaments. Really cleans up a signal and, with that, punch. Bugsy, it was 20 min.s getting thru. Best QSO of the BK. Tks.
Tks Don for the call. We made it! My vote for the best worst sig! A joy to hear.
Heard nil of or about KK7UV. ??
Jerry, W1ZB had the best fist. Smooth...
Hi Tim, tks for the QSO.
This years count was 35. 5 / 40 29 / 80. Bugsy / 160 Guess no W2ICE/VE3 next year for me.
73, VE3AWA

Sorry for the wait.
You weren't strong but if it had not been for local noise the QSO would have been much easier.
This QSO goes on my highlight list then!
I wouldn't want you to ruin your BK signal... but if it had been a pure tone I could have used a narrow filter to dig it out. By next year I hope to be running a MOPA with a somewhat less buzzy note.

Does anyone know what N8YE does to his rig during the last couple hours every year?

Hi Steve,

Yes, I sometimes use a 2x203A Colpitts rig ("The Rollins Rocket")...

But when I worked you on 160-meters a coupla years ago, it was with my 3x227 MOPA---AND a 3-element phased extended inverted "L" phased array, AND a k9AY receiving loop...both skyhooks having since fallen victim to our Great Ice Storm of 2013.

I forgot , metal automotive radios have common A and B voltage grounded in the unit so when the power is on as soon as the tube warms up I was on air. Thinking quickly I grabbed my carbon mike and popped the modulator module in the tank coil. I did a dit dit dit dah dit dit dit dit dah dah dit dah dit dit dah dit dah dah dah dit dit dah into the mic to keep it all legal and then killed it. Vib supply has no trouble powering it though. I may unfloat the ground for the B- or make a whole new unit after a trip to the wreckers for a spare old radio. Or I can just put an outboard battery for the heaters which would be quick and cheap like me (I used to be quick , now I am just cheap). I like the sound of the vib supply. Adds to the experience. I also have a 24V/110 dynamotor MMMMMMMMMMMMM?

Thanks . It is amazing to me how well these rigs work. A lot of time one doesn't get an answer because they sound funny and it makes the appliance operators nervous but when everyone is on the same page they are a lot of fun and very effective. I just realized tonight I don't have a colpitts rig yet so have been searching for an idea for a single tube schematic. I also realize I need more of my favourite tubes 01As. I only have a couple and I now have more rigs then tubes. If everyday was a BK day I'd sell all my other stuff and run this stuff. I run a Dx60B on AM sometimes with a twin 811A amp and really distance wise don't do any better. Something you cooked up yourself is a lot more fun. The two rigs I used the most this weekend I built with in the past two weekends. A great way to spend a Saturday. Now to have them perform well is icing on the cake.
Yeah it was a blast.

Hi, all.

Just catching up with emails; "screen time" was trumped by the BK last weekend!

Not relavent to '01As, but I've found a pair of 71A's in my PP TNT will run at 10W input without exceeding the 180V maximum plate voltage specified for them - I actually have to throttle them back a bit so as not to exceed 10W. Basically, a '12 is an '01A on steroids, and a '71A is a '12 on more steroids. Both tubes were developed to use in the audio output stage of radio receivers during the 20s to replace the '01A in that service, for more output power.

Just a data point - this PP TNT rig in a 1933 Short Wave Craft article coupled the antenna to the plate tank directly though a fixed capacitor. Not an absolute guarantee that it was legal, I suppose.

Apologies for the file size but I think there is enough interest on the list to justify it, and I wanted the text to be readable.

Larry,

My modified Hartley with Xtal control is coupled in a similar matter. Even the ARRL signed off on this technique. A popular League publication at the time was “How to Become a Radio Amateur.” and sold for 15-cents. In that publication, the output coupling network shown is identical to that described by George Shuart in the construction article you linked to.

By the mid ’20s, ham band allocations were designed with harmonic relationships for the very reason that harmonic content was not yet fully controlled with simple CW transmitters. It was only a couple years prior that spark was still king of the airwaves. I suspect that as long as the harmonic fell within one of the ham bands, the FRC likely did not care – not until rules concerning harmonics and spurious emissions were more clearly codified.

Steve

Just a data point - this PP TNT rig in a 1933 Short Wave Craft article coupled the antenna to the plate tank directly though a fixed capacitor. Not an absolute guarantee that it was legal, I suppose.

Apologies for the file size but I think there is enough interest on the list to justify it, and I wanted the text to be readable.

10345. BK Report de K4JYS

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-15 14:57:22 UTC
From: Bill Stewart
Topic: 10345 Message: 10345

GM All,
Man, what a bummer....a whole year 'till the next one. This years BK
was my 12th....and I still want more...hi.

Both the Hartley (210) and Meissner (C-301A) worked flawlessly. In fact
the longer they worked the fewer burps and jumps they made. I have a very
nice looking National Union 210 that I bring out each year for the BK. It
always seems to need a few hours of cooking to get the kinks out. Also, a
big globe 280 for the p/s...these tubes are at least 85 y/o and still preforming
like they would have back in the '20s....just amazing! And the 'lil '01A...well
it just keeps on ticking as well.

Even with generally marginal (yukky) band condx, hours on 40m with
no AWA sigs but my own, looking at the clock, will six o'clock ever get
here?..sore shoulder...tired and sleepy....and when six PM did come, a bit
of sadness knowing the fun was over 'till next year. All this said, I still managed
to eak out a new personal record.

I don't have very good 160m receiving setup, but did work Buggsy, W0LS,
K0KP and my good NC friend, Ron, N4GJV. I probably should have spent
a little more time on TB. The Inv. L w/4-wire CP sure helps on xmit. The band
was very noisy, so the MN stns were very hard to copy.

I made abt the same number of contacts on 80 & 40m. Boy, I really had to strain
my ears on some contacts. But with patience of the ops, I don't think I had to
scratch anyone. Sunday afternoon I heard W2AO on 40m with a pretty good
sig...well, I must have called him, off and on for an hour, a half doz times...not even
a QRZ from Stu. I finally gave up. Later he answered my CQ and we had a
good contact with good reports....ain't condx funny sometimes.

BK highlights:
Worked Scott at W2ICE/0 on 80 & 40.
DX : VE7SL on 80 & 40m...almost gave up on finding Steve on 80m but we
finally worked at 0507Z. Worked Jim, W8KGI in NM on 80m; KK7UV,
Steve..MT, on 80 & 40m; KE0Z, Will, in SD; Lou, VE3AWA...and a new VE
for me, I think...VE3GRO, Harry.

New Stns: I may have worked some of these stns in previous BKs, but don't
remember if I did: VE3GRO; N3GJ-George; WB8AFR-John; KC9WYV-Joe...
the young lad in MN, tnx to Harold, KB0ROB; AA2YV-Bill; maybe Will, KE0Z
was a new one for me too. New or not, great to work them. A sorta of a special
new one for me was Fritz, W4NTO. A few years ago I got an OO card from
him re. my chirpy Bare Essentials 50C5 rig. He included some suggestions on a
better osc...and later, to my surprise, sent me some tubes and parts to make the
better osc...which I did...a 6AG7 from a 1950 QST and it works wonderfully. I
still use the BE, as orig. built, but pick and chose the xtals, which helped the chirp

problem. Fritz is truly a gentleman and a first class ham.

Wrap-up: The BK is a real testament to the fine operating skills of the participants, the efforts to keep the history of communications and ham radio in the forefront...not just in books and collections, and a great vault of knowledge and technical expertise. This knowledge must be passed along to the future hams. Thanks to the AWA this is being done. Also, kudos to Scott, WA9WFA for all the work he does to keep the BK going...tnx Scott. And hats off to all who pulled me thru the noise and QRM. I hope everyone has a very Merry Christmas and a wonderful 2015.

From: Daniel Petersen
Topic: 10346 Message: 10346

Well... nothing much to report! I had the Double-M up on Saturday evening and tried a sked with Steve-VE7SL on 80 meters but no joy. I could not hear him and conversely he could not hear my one-watt "MM". Listening during Saturday evening I heard no one. My "new" QTH in a retirement village does not lend itself well to good antenna systems. My 16-foot flagpole is all I have now although I have made SSB contacts in South Africa and Antarctica. Perhaps I would have better luck on 40...

Well, I got into the BK as a novelty and do not take it quite a sseriously as many here, but i do have fun with it.

I only made 11 QSOs this year with several stations on both 40 and 80.

I also got to record a few of the stations from my other rig. (K3)

I was active in both the ARRL 160 and ARRL 10 meter contests and took some breaks to play BK.

antenna was a low fan dipole for 80/40.

Log will follow soon.

Barry

NF1O

If it aint fun, don't do it.

Larry:

Tks Don for the call. We made it! My vote for the best worst sig! A joy to hear.

Hey! I thought you gave ME that honor for my 40M sig!

I'm speaking out of turn here, I but I suspect you got displaced when he discovered a superior best worst signal. I gave Don a T5 and might have been stretching it? Not sure, as I wouldn't know raw AC if I heard it, let along some of the other categories. I just guess once we get below T7 or so. ;-)

Barry NF1O kindly made a recording of my 80M sig but mercifully didn't record me on 40M.

You haven't escaped! I have recordings of you on 40M. I'm reasonably sure I also have Don but have to go through the files I hastily saved and find it.

10352. BK report at NE1S

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-15 21:33:27 UTC
From: Larry Szendrei
Topic: 10329 Message: 10352

I just went through my scribblings and filled in my log sheet.

Bottom line: 20 QSOs on 80M and 21 on 40M for a total of 41.

This is the first year my 40M total exceeded my 80M one, It may be in part due to the fact that I didn't even bother getting on 80M the first night (12/5); I ran out of steam as I explained earlier. But the low 40's for a total is my normal, so I guess it didn't hurt too badly except for missing out on more fun, which is what it's all about anyway. This year I didn't even bother to get on 160M. It hasn't been preoductive for me in the past, and I'm not happy with the way the TNT works & sounds there (you'd think it would be the easiest band to deal with, but for some reason not for me).

Although all BK contacts are cherished, my most memorable ones were VE7SL on 40M (best DX for me, and we both worked hard for it!), and W2ICE/0 on 80M.

I had a really hard time finding anyone I hadn't already worked late yesterday afternoon on 80M - I only made 2 BK QSO's in the time I was up there. However, I had 3 that didn't go in the log because I was called by an ragchewed with two friends and one interested bystander who was familiar with the AWA and had visited the museum, but was not participating.

I'm sort of in-between as far as my commitment to the event goes - definitely more than a casual participant, but I don't let it interfere with my normal sleep schedule (usually 9PM - 5AM), my daily workout, and certain other responsibilities. (Yesterday I took an hour-long bike ride mid-day, and before that spent a couple hours with my friend K1MV who was kind enough to come over and help remove the broken reflector element from my Cushcraft A3. The Thanksgiving snowstorm was not kind to it - the snow was wet and heavy and (after 25 years aloft without having to do anything except clean insect nests out of the traps and replace the trap end caps) the tubing buckled right at the boom such that one half of the element was pointing toward the ground like a dagger! Yesterday was the first sunny dry weekend day above freezing since that happened, so I needed to take advantage of it.) I'm definitely not in the league of VE7SL, N1BUG, K4JYS, and W2AO; I think Don used the word "relentless," and even before he said that the word occured to me to describe their effort.)

I hope all participants had as much fun as I did. My only regrets are not having the energy to get on 80M the 1st night, and still not logging KK7UV or W7OIL.

73,
-Larry/NE1S

UPDATE
Got er done. This PS takes some of the sag out, Completely isolates heaters from cathode influence as far as blinking goes. My other supply was modified to run my TNT years ago and has had so many mods I forgot where I started. This one came from my junk box except for 3 diodes. I think I may lose my standing for best worst signal. It makes both the Hartley and the TGTP stand up and take notice. I didn't measure the Hartley yet but the TGTP showed 281 volts key down at 31.5 mils. it even has a meter hole in the cabinet so I may install one. Sets are more stable on this supply but it cant run the TNT because it does have 2.5 heater ability.

1950's Sucker Stick Xmitter

CLICK ON THE PICTURE FOR LARGER IMAGE. This 1950's transmitter using a single 6v6 tube was constructed on wooden strips by Jon Zoller (now deceased), W5ZWQ of Tulsa, Oklahoma. The coils were wound on sucker sticks. A second set of coils can be seen to the right of the transmitter. My first transmitter was an identical one that I constructed using an article titled "A Simple Transmitter" in the 11th edition of "How to Become a Radio Amateur".

It is also in the 1948 ARRL handbook along with its big brother now known as the Longfellow.
Maybe we need a 30/40s tube weekend. Rock bound or not , free choice. I have three ready to go. A MOPA, the BE and a 6l6 Am rig. Same procedure, different rigs.
I think I would get dizzy winding those coils but many did! I was talking with a Ham in Home Hardware last fri and he was telling me how he started out with that type or rig as well (VE3BPL) He was telling me about winding the coils.

10361. BK report de n4gjv

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-16 04:47:02 UTC
From: Ron Barlow
Topic: 10361 Message: 10361

Hi guys!
I was not QRV for the first weekend of the BK QSO party, as I had conflicts with other activities.
In addition, my antennas were laying on the ground, victims of an ice storm, last winter. The re-erection task was not completed until ~ 1 hour before the 2nd weekend activities were scheduled to commence!

I had 2 goals, for the weekend.
#1 and foremost was to have fun.
#2 was to log at least one contact on each band, if possible.
I did indeed have fun, but Murphy attempted (unsuccessfuly) to prevent goal #2 from being a reality!

I was already late for the 2300Z start time, when I discovered that my old SB-300 rx had a mechanical problem, that I was not able to quickly cure.
I could have used my 24A/27/27 regenerative rx., as I did for many of my QSOs, last year. However I no longer had the means to readily match my transmitter and receiver frequencies, due to a kaput freq counter. One of the regen's inherent shortcomings, is its tendency to overload, under strong signal conditions, so using it alone, for such a purpose, is a lesson in futility.
I was able to use my homebrewed single band superhet rx on 80m (normally used as a tuneable IF on VHF & UHF), so that part of the problem was solved.
The regen was my only option on 160m. The lateness of my arrival (0240Z), and the time consuming and tedious task of performing the zero beating chore probably caused me to miss some of the 160m action??
For 40m, I decided to attempt to use an old BC-455, that had been resting in my garage for many years. I had to reform the electrolytic caps, in the power supply, and retune the BFO, which for some unknown reason, was offset far from the wide IF passband. The old rx now worked fine, but the clock had marched on, past the 1815Z mark.
I soon found that the suggested 7100-7125 khz band segment seemed to very narrow, when using a receiver with such a wide IF bandwidth, plus the "ability" to hear both "sidebands" equally well! Not much tuning required! Leave the tuning knob parked, and simply use the ear/brain filter--well ear filter, anyway-- to choose which pitch to listen to!
The actual limiting factor, on 40m, however, seemed to be my QRPP xmit signal. I did contact a few stations, but many others were called w/o success.
My 40 & 80m inverted vees had been brought down by an ice storm last winter, and when I re-erected them, I decided to relocate them to the same ~33 ft tall mast, that supported my 160m inverted vee.
Unfortunately, a very long feedine (200 ft) is required to reach the relocated antennas, and some well aged RG-58 type coax was all that was on hand, to do the job. The excessive feedline loss, which would be larger, at 7 Mhz, vs 1.8 & 3.5 Mhz, may explain why I seemed to be unheard by so many, on 40m.

Many thanks to all for the absolutely great fun, and for putting up with the many sending errors, the result of arthritic hands!

I particularly enjoyed contacting my friends "Bugsy", N1BUG, and Bill, K4JYS, on all 3 bands!

Vy 73 de Ron n4gjv

Sounds like life! You did well! Wish I had logged you. I have a BC454 here. Fun but, well you know. I prefer my regen for CW work also. I use a very low power osc to spot it which I can check against any of several digital rx here in the shack for freq. It has worked well for me. I always feel dishonest if I am using a modern rx and a pre 29 TX. Or even a big boat anchor RX. Seems like cheating. However I did us my HR10B for the BK. it is darn near deaf compared to the regens so is no advantage. I have given it the award as the worlds worst shortwave receiver. Anyway you efforts to restore your station in time were interesting. Hope to work you some time.

I have a bunch of 7 series tubes and stripped a radio but I can't remember where I stashed the sockets. I'm thinking. I definitely didn't throw them out. Always thought some day I would build a locktal station. (which would probably only use 2 or 3 sockets.)

10367. Further Adventures with the TGTP

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-17 09:59:23 UTC
From: dulmagedon@...
Topic: 10367 Message: 10367

After the dust from the BK settled I went back to work on the TGTP rig. I found a proper rated bulb for the plate current indicator an removed the one I had in and installed the new one with its nice red lens and bezel in the front panel. It works as advertised and with a sniffer bulb sitting on the tank coil (one turn) and the red indicator on the panel tune up is a breeze. Put the red light out and the white one bright. I also discovered that the rig will , like its Hartley cousin tune 40 meters just fine as well as 80M. I came to the conclusion judging the position of the movable plates in both the grid tank and the plate tank. they happen to sync BTW despite the huge difference on size of the coils there is less then 5 numbers difference between Gr tune and plate tune. So after trying 40M I wondered if by any chance it would sneak down to 160M since the plates on 80M were 1/2 way. 3/4 on 40M. It will. The grid will tune down to 1999 kcs and the plate will go all the way it would appear as there is room for more C when at 1999kc. The lead from the grid coil has enough to add perhaps 3 turns back on the form and then bring it off with a new lead. That should put it will and safely into 160M and still comfortably hit 40M with room to spare. If so this would be a continuously tunable three bander which would be nice .During my tests I also made a boo boo. I have only two 01As. One is very good and I use it all the time and have for a year or so. The other I acquired recently and it is good for about 4 or 5 minutes then gets dirty and balky. It carrys the engraved base 201A while the good one has a fancy 01A printed o its top. I was using the bad one inadvertently so if any heard it as it began to crapout yesterday I apologize. I shouldn't be using it. Have to increase my supply as I have more radios then tubes now. I also need for a restoration project a 26 tube should anyone have one they would sell.

Hello all,

Can someone please tell me the name of the device that was by the old timers, back in the good old days, that allowed them to zero beat their regen receivers, with their transmitters?
It essentially consisted of a shielded one tube regen receiver.
Unfortunately, I cannot remember the nomenclature, to save my life! Old age is truly an adventure!

I vaguely recall that someone may have included some info, on such a device, on their web page??
However, I was unable to find anything, without knowing the name of what I was searching for!
The search engines provided lots of hits, when I attempted to search for a "whatchamacallit", but none of the hits provided the info that I was seeking!

Thanks for reading this!

OK, I am missing something. What was asked for was something to help zero beat, but, I think what has been offered was a monitor so you could hear yourself while transmitting. That is not the same thing. I cannot think of what the item may have been called that actually allowed a zero beat. In my opinion, this implies both the transmitter and the receiver to be on simultaneously. While most of these rigs did change frequency somewhat under varying loads, I think the easiest way would be to switch the transmitter into a dummy load and then tune the receiver. That should be close enough. 73 – Mike

Hi, Mike. I think I can help.

From earlier posts by Ron, (and knowing his interests), I am guessing that he posed this question because he wants the ability to set his transmitter on the same frequency that a regenerative receiver is tuned to. Even into a dummy load with a low-power transmitter, the local signal is usually so strong that it will "block" the regenerative detector. Therefore some kind for "third party" is required: either a superhet receiver with BFO or product detector, or a monitor-like device. I use an LM-5 frequency meter for this purpose.

The 1931 ARRL Handbook has a whole chapter on monitors and frequency meters, and it appears "monitors" were indeed used to help set transmitters to the same frequency as the receiver. From page 77:

Hi Larry –

Yes, I agree with all of that. I knew even with a dummy load it would be too much for a regen. He did ask what they used in the old days, and, they certainly did not have the methods you mention. So, what if anything was used? Sure today, and, even back in the 30's other methods were available, but, back in '29 and earlier, I am not sure. So, reading the below article, a tunable oscillator with detector was used, which is what I would expect. However, it was still used one at a time. First with the receive then with the transmitter. Come to think of it, I think I have something here meant just for that purpose. I'll dig it out and share what it is. Thanks & 73 – Mike

If it was for checking the quality of your note, it was called a Monitor.
If it was for checking frequency it could be either a FreqMeter or a
Wave Meter. Both came in varying complexities; some with a lamp
others with a meter.

I use a Monitor even on my 1930s TX.

It may have been called an Iso-synchronometer (spelling ?). I believe it used a mixer function for zero beating.

Have you tried the old trick of putting your transmit crystal in series with the antenna input? The sound as you pass the resonant crystal frequency is unmistakable. My "Paraset" will exhibit a faint "thump" in the receiver at the crystal frequency is crossed even though it is still plugged into the transmit crystal socket!

10381. RE: [AWA Group] Regen receiver operating aid

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-17 19:20:38 UTC
From: Steve Flood
Topic: 10371 Message: 10381
Attachments: 2 described; binary payloads are missing from this source WARC

The “monitor” most certainly can be used for zero-beating. Unless the ‘monitor’ term is ambiguous in the old literature, I presume we are talking about the device seen in the 1929 handbook and July 1927 QST, which I have built and use with my ‘29 gear.

If I hear a station calling CQ on my receiver, I tune their signal into the zero-beat ‘dip’. I then tune the monitor until I can hear the monitor signal zero-beat ‘dip’ in the receiver. The receiver and monitor are now netted to the same frequency.

I then mute the receiver and key-down the transmitter while listening in the monitor headphones. I tune the transmitter until I get a zero-beat dip in the monitor headphones.

Now the TX, RX, and monitor are all on the same frequency. I then merely tune the receiver to one side of the signal to hear the calling station and the monitor tone and then mute the monitor while receiving. To transmit, I mute the receiver and turn on the monitor to hear my sidetone.

Well, surprise, surprise, I found what I was looking for and took a few pictures. This called an Aero Monitor made by Aero Products. It is battery operated, uses a type 112 tube, and has a socket to accept coils for different bands. The tube in it is dated 1929, so, it is even period correct. Here is a link I found on the web:

http://www.eht.com/oldradio/arrl/2007-02/AERO_monitor_and_converter.htm

I believe this could be used to do exactly what Larry described. 73 – Mike

Hi Larry –

Yes, I agree with all of that. I knew even with a dummy load it would be too much for a regen. He did ask what they used in the old days, and, they certainly did not have the methods you mention. So, what if anything was used? Sure today, and, even back in the 30's other methods were available, but, back in '29 and earlier, I am not sure. So, reading the below article, a tunable oscillator with detector was used, which is what I would expect. However, it was still used one at a time. First with the receive then with the transmitter. Come to think of it, I think I have something here meant just for that purpose. I'll dig it out and share what it is. Thanks & 73 – Mike

Hi, Mike. I think I can help.

From earlier posts by Ron, (and knowing his interests), I am guessing that he posed this question because he wants the ability to set his transmitter on the same frequency that a regenerative receiver is tuned to. Even into a dummy load with a low-power transmitter, the local signal is usually so strong that it will "block" the regenerative detector. Therefore some kind for "third party" is required: either a superhet receiver with BFO or product detector, or a monitor-like device. I use an LM-5 frequency meter for this purpose.

The 1931 ARRL Handbook has a whole chapter on monitors and frequency meters, and it appears "monitors" were indeed used to help set transmitters to the same frequency as the receiver. From page 77:

GA all,
Lou, this is sorta directed at you. This is an update on a P/S for the '24 Meissner (160m) that we talked a bit abt, a few months ago. I found a CX-316-B on ebay to go with one I already had (the tubes are half-wave). I cobbled up a full wave supply with only one filter cap (10uf) and a bleeder resistor. The junk box xfmr does not quite have enuf voltage to give me 300 vdc, which is what I was using from a Heathkit bench supply and have been running on the '01A...only getting abt 260 or so with this HB supply. Therefore the input pwr is now around 4w....it was at 6w. I also had to use a 12vac fil. xfmr, with (2) 1 ohm dropping resistors to get the tube fils. near 7.5vac. Anyway, it has a good tone so will probably use it some with plans to get a xfmr with a little higher secondary. The tubes aren 't quite period correct, but close enuf 'till something closer comes up.

GA Bill and thanks for the news.

Lou, this is sorta directed at you. This is an update on a P/S for the '24
Meissner (160m) that we talked a bit abt, a few months ago. I found a
CX-316-B on ebay to go with one I already had (the tubes are half-wave).
I cobbled up a full wave supply with only one filter cap (10uf) and a bleeder
resistor. Like you, I've found that as far a quality of tone goes, a choke is unnecessary.
Surprised me...
The junk box xfmr does not quite have enuf voltage to give me 300
vdc, which is what I was using from a Heathkit bench supply and have been
running on the '01A...only getting abt 260 or so with this HB supply. Therefore
the input pwr is now around 4w....it was at 6w. I also had to use a 12vac fil.
xfmr, with (2) 1 ohm dropping resistors to get the tube fils. near 7.5vac.
Anyway, it has a good tone so will probably use it some with plans to get a
xfmr with a little higher secondary. The tubes aren't quite period correct, but
close enuf 'till

10400. Many thanks re monitor info

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-18 02:50:39 UTC
From: Ron Barlow
Topic: 10400 Message: 10400

Hello all!
Many, many thanks to all for the great info regarding the "monitor"!!
Yes Larry, you hit the nail on the head!
As Larry, Mike, and others mentioned, the regenerative receiver does indeed overload severely, when attempting to perform the frequency netting operation directly.
In addition, if the antenna impedance deviates from a 50 ohm, non reactive condition, the regen receiver and the Hartley transmitter are both subject to being pulled substantially off the frequency that they were set to, when connected to a dummy load (47 ohm 2 watt resistor).
I suspect that the rx would shift less than the tx, due to the fact that it is not coupled as tightly to the antenna. Nevertheless, it does shift.
Pruning the antenna more precisely to resonance would help, at least over a narrow freq range, and when the antenna is not wet or ice coated. However, I didn't have the time to do that, after re-erecting the antenna in its new location.
I intend to construct such a monitor, in time for the LC event, in January. I had to resort to an awkward, time consuming makeshift method, during the BK event.
I hope to "see" many of you, in the LC event!
Again, many thanks!!

Not N1BUG - As far as I know, he doesn't have any "classic" amateur gear; plus I know what he looks like and he's younger. And definitely not N3IBX - there's no radios stacked on the floor with only corridors in which to move about ;-)

That leaves, by process of elimination, 9CXX.

I checked my stock and don't have those values.

If you don't find them from one of us, they are readily available from the big online parts vendors (Mouser, Newark, Digi-Key, ...) though not cheap at $3 or $4 each.

Paul

Very nice job, Dan.

6V6/807 MOPA?

Looks like the knobs on the upper right panel of the original may have
been made by National.

To answer the original question wrt the LC, "of course!"

In the 50s Collins Radio opened a division Known as Collins Radio of Canada on Burmonsey Rd in Scarborough Ontario. They had the contract for the radios for the AVRO ARROW and the "Gas Can Radio for the Voodoo Fighter jets(ARC552). This relationship was closely watched by Art C hisself . They hired a young Radio Design Engineer away for GE of Canada for these projects. That man was my Father Harry B Dulmage P Eng still living at 91 years old and I got my interest I Radio from him. I used to know most of the engineers and techs at Collins Canada even after it be came Rockwell till it was closed. (I could probably still name most of them. Dad used to fly to Cedar Rapids often on business trips. First in Collins Company Beechcraft and later in commercial planes like some of the first Viscounts. Dad was lad when the went to commercial airlines .I remember him telling me after a trip there and back in the Beechcraft it took about a week for his teeth to stop rattling. Dad had told me Arthur would sometimes operate Air mobile and they would pick him up on a rig they had at the Burmonsey road plant. For you VEs who have been in and round TO the plant was at the end or curve of the road . Peak Freans Cookies was on the corner and Snap On tools about half way around on the same side . Every Friday when I go to play at my local country Jam on of the techs who worked there when Dad did is there playing guitar. He must be close to 90 as well. When we started Certellecom Labs (now owned by Nemco in Norway) we bought the shaker table and two environmental labs plus a portable Farady room from Rockwell as they were still there from these old military contracts and were "like new" When my older brother and I picked them up in a rental truck about 1/2 dozen of the old crew who worked with Dad and had seen us boys on Sat mornings if Dad was in to shutting down a TX/ RX test sequence or something which was quite often , came out to see us telling us they remembered us when we 6 and 7 years old. Collins was very good to their empolyees. Dad quit more because of the Arrow cancellation then anything although he did stay to finish the Voodooo Gas can radios. Collins paid Dad to go to Lockheed at the beginning of the project for the Voodoo Radios to map out the radio size and panel location. It was a rush job so they paid for him to take holidays each way and take the whole family.(My Mom and five boys!) A week down a week there and a week home. Not many companies would have done that for an employee and his family. Not then and certainly not now. Never heard Dad saying anything but good stuff about Arthur Collins. Even now.

10422. Regen spotting

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-18 20:01:15 UTC
From: dulmagedon@...
Topic: 10422 Message: 10422

I use a different method for regen spotting but it s for a rockbound rig HOWEVER this got me thinking. In one of the old Radio Handbooks 1940 there is a 15 watt VFO . I have stolen many pieces of that design and had noticed there is a circuit in there for rx spotting right in the build. I don't have it front of me but it seems there was a switch called Rx spotting the switched a 225K resistance into the B + line killing the transmitters output to a mere whisper so it would drown the rx. SO Ifred up my Hartley with a dummy load attached and began adding resistors to the B circuit - (Across the key line if you must know.) At 100K the Tx still keyed but output was low, very low and there was no sign of any bulb lighting on the dummy load. The freq being monitored on a digital Rx hadn't changed a noticeable amount but the strength was greatly reduced. I don't know but suspect that each TX has its own minimum spot . Obviously mine will probably go lower. Seeing as how I use a low power osc to spot with a crystal for crystal rig ops I know that a very low power osc does a fine job of spotting a regen. I intend to explore it further.

Hi Don,

I started work in an outfit called "TRENCH ELECTRIC" on Midwest Road in Scarborough in February 1975, & the newly-minted Prez of the company had just come over from Collins at that time...!

At lunch I used to take the occasional drive down to the Collins facility in those days in my '69 Beaumont, & just gaze at the place, with visions of S-Lines dancing inside my head...!

You should have gone in, Eddy. Their library had bound copies of QST from 1920 up. I worked a short walk away and would spend my lunch hour there reading. Lou

10425. Silver Mica Caps for 80 M Filter...Thanks

Joe, Thank you for leading me to both those sites. too. Very helpful for this and future projects.

BTW Where did you go Sunday afternoon?

Thanks, Dan for the offer. Let's see how things go. Will let you know.

... though not cheap at $3 or $4 each. Paul, If your going into production, no.

73, Lou

I checked my junk box and don't have those values. I see that "just radio's" up by you seems to have a large selection with the values and voltage ranges you are looking for. Mite be worth a look see:
500 Volt and 1000 Volt Silver Mica Capacitors - on sale
Surplus Sales has them too but they are pricey:
Micas, Dipped Radial - 300pF to 60,000pF

Good luck in your search

73 and Merry Xmas,

Joe N2OUV

Lou, I have a "sharable" quantity of the following:
300pF
560pF
620pF &
1100pF
all 500v SM.
If you can "parallel-up" any of those values, let me know.

-- 73, Dan - W7OIL

I checked my stock and don't have those values.

If you don't find them from one of us, they are readily available from the big online parts vendors (Mouser, Newark, Digi-Key, ...) though not cheap at $3 or $4 each.

Paul

No but my memories are somewhat older. Dad's boss was JP Jocoletto. Engineers were paired with a electronic technician. Dad's was a genius named Dan Fletcher. Dad told me once Dan had 17 patents just on the Arrow radio project alone. Mechanical devices many. His daughter many will know because she sold the Lela Fletcher Piano books many music teachers used. In the 50s one evening I was at Dan's house with dad and he showed us a TRANSISTORIZED organ he had made and demonstrated that. He was also I believe the first pilot in Canada ever licensed wearing glasses. It was one of his missions in life to become a pilot and that was an obstacle which he worked unceasingly to get rid of and eventually succeeded. An engineer who worked closely with dad and was a friend was Floyd Rodin. He passed away a few year back but lived near us in Stouffville (we lived in Altona) so whenever practical the two of them rode to work together. Floyd's Electronic tech was Don Thompson who I see at the Fri morning jams in Stockdale. I asked him what he did once and he told me he worked for Rockwell. I made that Collins and he said well yes. When I told him who my Dad was he said he had wondered because our name Dulmage is unusual being the englishized spelling of Dolmetsch and not often seen. Werner Kabalca was another I met. More will come to me. Dad was heart broken when the Arrow was cancelled. The Arrow radio had over 400 channels with a synthizied front end of sorts. Previously 9 channels was normal. It flew around for about a year and then , well you VE guys know! Dad designed the Voodoo radio but he wasn't the same. The drive, the spark, the excitement was gone and never returned One day he quit. I asked him why because I knew he had loved his job and the people he worked with a for. He told me about the radio and its unusual design and said to do all that and then have some idiot in government cancel and scrap it in one moment of stupidity was more then he could handle. He never again worked for any company doing military contracts. We left that area in 1962 so that must be when he quit. I was 12 years old then. He went on to be chief Engineer at MEL in Arnprior but I think it lacked the challenge so he became chief Engineer of Pye Electronics Canadian division in Montreal. After a decent career there he used his scholarships previously earned and his veterans' benefits from WW2 (He was an instructor at No1 Wireless school during the war. Radio was his life even as kid) and added an MBA to his list of University degrees. He stated his own consulting company and eventually with me as a director and share holder Certellecom Labs. The first ever approved EMI test lab in Canada. I asked him once when life was best and he said without hesitation during the Arrow project at Collins. He said Arthur told him and his team to spare no expense. "Make sure that is the best ever built. Cut no corners and don't skimp on materials." I know a bit more about both those projects but if told it all they might have to kill me ;>)
He still speaks of anything Collins with reverence. Sorry but it brought back a whole flood of memories for me.

I was just wondering. I do not know the parameters you are trying to achieve with the filter. Like, passband width, stopband rejection, and so forth. Whenever I need a filter I design an Elliptic (Cauer), using the table of normalized element values. 73 – Mike

10460. Re: Regen spotting

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-19 21:10:35 UTC
From: dulmagedon@...
Topic: 10422 Message: 10460

I am glad this question was introduced even if sort of in a different direction. I have had this on my mind but never got my butt in gear to prove it out. Till yesterday and today. Yesterday I tested on the TNT to see how much resistance I could introduce into the B circuit and still have on freq oscillation. I was able to put 90K across the key terminals and the rig would oscillate on freq at a very reduced rate. I don't have a regen set up down there as my tube count is low but upstairs I do have my BareEssentials 50L6 rig which I have used even recently with some of you last November. I run a 50C6 in it just in the hope I get a bit extra. I just say that to keep it honest. I doubt it would make much difference in this test. I listen as some of you know on a 6sl7 twinplex regen running on battery power. Pervious to this point I used a small hand held chip osc to spot the regen to the crystal I was going to put in the transmitter. Today I took my resistor chain I tested the TNT with and brought it up to the Bare Essentials rig and rigged it across the key terminals . It is cathode keyed so basically introducing resistance into the B - circuit and dropping B voltage. I fired up the regen which before could not handle the BE rig key down. With 90K in the key circuit I could easily find the TX on the regen however it is very quiet on the band today and when I tuned by it I got just a sharp "blewp". No swamping of the regen just a nice easy to find signal. Figuring that in a night with QRM that might be a bit quiet I played around and came up with 60K introduced into the B- across the key terminals did NOT swamp the regen and I was able to find the signal easily and very distinctly on the regen. A very practical and easy solution to the spotting a regen with a Vintage TX. I am very happy with the results. It works much better then I thought it might. Now to mount a switch to introduce it when key is released and I want to spot. I would like to mount it with the key then it is portable between rigs. However I may mount it in the TX if that proves awkward. Anyway it works and works very well. And just because I used it with a regen doesn't preclude its use for other receivers.
don

---In AWAGroup@yahoogroups.com, <dulmagedon@...> wrote :

I use a different method for regen spotting but it s for a rockbound rig HOWEVER this got me thinking. In one of the old Radio Handbooks 1940 there is a 15 watt VFO . I have stolen many pieces of that design and had noticed there is a circuit in there for rx spotting right in the build. I don't have it front of me but it seems there was a switch called Rx spotting the switched a 225K resistance into the B + line killing the transmitters output to a mere whisper so it would drown the rx. SO Ifred up my Hartley with a dummy load attached and began adding resistors to the B circuit - (Across the key line if you must know.) At 100K the Tx still keyed but output was low, very low and there was no sign of any bulb lighting on the dummy load. The freq being monitored on a digital Rx hadn't changed a noticeable amount but the strength was greatly reduced. I don't know but suspect that each TX has its own minimum spot . Obviously mine will probably go lower. Seeing as how I use a low power osc to spot with a crystal for crystal rig ops I know that a very low power osc does a fine job of spotting a regen. I intend to explore it further.
don

10461. Re: [AWA Group] Re: Regen spotting

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-19 21:30:45 UTC
From: Larry Szendrei
Topic: 10422 Message: 10461

Don, this method will work well enough for an xtal-controlled TX, but the frequency shift of an LC oscillator (TPTG, TNT, Hartley, Colpitts, etc.) with the dropping resistor may be significant. It is with my Hartley, anyway. If I used this method to spot I would be several KHz off-frequency.

Do you have a modern receiver, or frequency meter or counter, to compare the output frequency of one of your LC oscillator rigs with and without the dropping resistor?

what is ur filtre for Lou? VE7SL

An 80 mtr. bandpass. One of the questions I have is whether or not one is really necessary considering our typical low power, dipole and ATU use. I'm reading 30 dp down on the second harmonic. Again, considering, is that amount worthwhile?

I would not even consider that...your tuner will knock anything like that down enough and at the power levels we use, any harmonic energy is pretty low. Your P-P rig doesn't even produce a second harmonic, one of the advantages of a P-P cct.

Steve, OK... Should have asked if necessary at the beginning. Yet, with an ATU etc. in place, at what power output (from a oscillator rig) would a band-pass filtre be wise to use?

Eddy, Thanks for the work you put into this. Much more information than I had before on this.

73, Lou

In this case, I can't help. The closest I have is a Majestic G-71-A (UX-171A equivalent) of unknown age and condition (other than it seemed to work FB in the TNT) Paul

If you're serious, that may be close enough for Lou. Larry

I would not dream of asking them to part. Lou

Actually it works perfectly TNT, Hartley and Rockbound as well. The idea is not mine as some may have erroneously thought but comes right out of the pages of the 1940 Radio Handbook 9which is sitting right beside me as I type) for use in spotting a 10 watt Hartley based VFO. There is a schematic and a short description included. The resistance was introduced in the OSC supply voltage. They dropped the OSC from 400 PS voltage to 250 Rx voltage and introduced a 5 k resistance as well. I did it all with a resistor but the effect is the same. In testing using a digital rx with narrow CW selected I was able to detect the note full power or reduced spotting power with no changes to the control which is all you need for Ham radio work. My stepping was set at .1khz. (I said "point one")If that won't help you neither can I. It is certainly good enough for any ops I engage in. Having built several successful regen transceivers I was pretty sure it would work but talk is cheap and so decided to test it and try it. I was and still am pleasantly surprised at how well it works.

Hi Lou,

If you're that obsessed with putting the kibosh to any harmonics from your '29 rig, how about constructing a half-wave COAXIAL CABLE "filter" for your rig...?

We did this very thing some years ago, during Field Day, to minimize interaction between a bunch of stations in closed quarters transmitting at the same time---and it worked for us (on 40-meters CW, where I was, anyway...).

The task is VERY simple, indeed. All you have to do---and you'll need one of these, for each band that you're transmitting on---is cut a 1/2-wave length of RG-58 coax able, TAKING INTO ACCOUNT THE VELOCITY FACTOR OF THE CABLE (HINT: the cable length will be some 66% of a half-wave in free space). Attach a PL-259 plug at one end, & SHORT the other. Now, place a "T" adaptor at the output / antenna jack of your rig: attach your antenna feedline at one end, & the 1/2-wave coaxial filter at the other.

VOILA!

Any out-of-band harmonics from your rig will be automatically shunted to ground, by virtue of that shorted end. But your fundamental frequency signal will be free as a bird to flow, unencumbered, to your antenna!

You can coil the coax filter into a small small loop & tape it to keep it from getting unravelled, & place it right at the rear of your rig. It's simple, and doesn't require any judicious tweaking of coils / capacitors in a hardware-like 1/2-wave filter, that you're proposing...

So---whaddya think...?

Tks Don for the call. We made it! My vote for the best worst sig! A joy to hear. Lou

Hey! I thought you gave ME that honor for my 40M sig! Larry

I'm speaking out of turn here, I but I suspect you got displaced when he discovered a superior best worst signal. I gave Don a T5 and might have been stretching it? Not sure, as I wouldn't know raw AC if I heard it, let along some of the other categories. I just guess once we get below T7 or so. ;-) Closer to a T-3. "Rough A.C. tone, rectified but not filtered."

I'm anxious to hear Lou's reply. Best-worst DX signal, Larry. How's that?

Barry NF1O kindly made a recording of my 80M sig but mercifully didn't record me on 40M.

You haven't escaped! I have recordings of you on 40M. I'm reasonably sure I also have Don but have to go through the files I hastily saved and find it. Paul Let us know when you find them, Paul.

73, Lou

OK, makes sense ;-)

The Radio Handbook shows a VR-105 regulator. Wouldn’t the oscillator would be at 105v regardless of the 250 or 400v B+.

I was going to make the same observation. I wonder how many people built that and had the VR-105 go "poof".

There should be a current limiting resistor in the 400 volt line going to the other switch contact. It does appear the intent was to have the oscillator always on 105 volts so it wouldn't change frequency when switching from one supply to the other.

73,
Paul

A simple test for it is to see if it will pass DC. Lou's circuit obviously does. Therefore, it is a low pass, with zeros of transmission above the design cutoff frequency. 73 - Mike

I have no idea why the filters Lou was asking about are called half wave filters. I was wondering that myself.

But as one who works with shorted and open half and quarter wave lines quite a bit, Mike is correct. A half wave line repeats the impedance. If one end is shorted, the other end appears to be a short to RF. A quarter wave line transforms from one extreme to the other: if one end is shorted, the other end appears open (very high impedance) to RF.

OK. I finally finished sorting through a few hastily saved sound files from last weekend. I didn't spent much time making recordings as I was trying to find a few last QSOs. Here is what I have. Some are brief snippets, others are full transmissions with exchange. Let me know if I have you recorded and you want the file emailed. Please advise if file size is an issue. I can edit some stuff out to make them smaller if needed. All are MP3 files.

N4GJV - 80 and 40
N8YE - 80 (Ford coil B+) and 40
NE1S - 80 and 40
NF1O - 80 and 40
VE3LYX - 80 and 40
W2AO - 40
W8AU - 40
WU2D - 40

I would like to start collecting "29" sound files for my web pages. I realize some are not comfortable with having recordings of their signal posted. I will not post any without permission. If you are on the list above and do not object to the recordings being posted to a web site, please let me know. I haven't a clue when I will get to that project... but eventually...

A file escaped, but has been captured. Add:

K1TMJ - 40

On 12/20/2014 12:59 PM, N1BUG paul@... [AWAGroup] wrote:

OK. I finally finished sorting through a few hastily saved sound files from last weekend. I didn't spent much time making recordings as I was trying to find a few last QSOs. Here is what I have. Some are brief snippets, others are full transmissions with exchange. Let me know if I have you recorded and you want the file emailed. Please advise if file size is an issue. I can edit some stuff out to make them smaller if needed. All are MP3 files.

N4GJV - 80 and 40
N8YE - 80 (Ford coil B+) and 40
NE1S - 80 and 40
NF1O - 80 and 40
VE3LYX - 80 and 40
W2AO - 40
W8AU - 40
WU2D - 40

I would like to start collecting "29" sound files for my web pages. I realize some are not comfortable with having recordings of their signal posted. I will not post any without permission. If you are on the list above and do not object to the recordings being posted to a web site, please let me know. I haven't a clue when I will get to that project... but eventually...

This afternoon the XYL and I stopped in at the local Antique cooperative. I know they had some radio tubes and am repairing a 1926 Majestic cabinet radio I was given. It has a open filament on its 26 tube so I thought I would have look at what they had.. Nothing that old unfortunately but about 200 tubes , New in box. 45 a piece. I came away with 3 25L6 tubes and a 117p7tube. They had several sweep tubes (6kd7?) or something like that I think they were. Anyway I intend to make another raid soon.

Hi Guys,

Some 20 years ago I responded to an ad in the local paper, saying that an older fellow in town was getting out of his basement radio repair business, & consequently was selling all of his tubes...

Well, I went to his place, & he had boxes & boxes of ALL types lying around. I immediately zeroed in on a box that had globe enveloped(!) 245's, 280's, 227's, 224A's, etc. etc."How much for just THIS box...?" I asked him.

"I can't sell you you just one box," the old timer responded. "It's all---or nothing!"

"OK then, how much for everything?" I went on

"Hmmm...you can have everything for $70.00,"he said.

I didn't waste one single nanosecond: I rushed to the ATM machine up the road, paid the man, and then with my young son's help, proceeded to fill the entire trunk, rear seat floor wells, and rear seats of our 1986 Chevrolet Caprice Classic with boxes & boxes of tubes.!!! It was the mother of all mother lodes...

That was a a great foundation for countless projects & dreams, ever since here...

10503. Paragon RA-6

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-21 17:34:36 UTC
From: Paul Christensen
Topic: 10503 Message: 10503

Anyone know of a Paragon RA-6 still in existence? If so, photos would be much appreciated.

This was a very popular spark tuner used prior to WWI, and it appears to have been used in many well-appointed stations, at least through the early '20s. Chicago Radio Laboratory (Matthews & Hassel at 9ZN) may have produced a similar circuit.

Paul, W9AC

10504. Re: [AWA Group] Two Board MOPA

Yahoo group: AWAGroup (2014 — 2016)
Date: 2014-12-21 18:17:48 UTC
From: Ron Barlow
Topic: 10162 Message: 10504

Hi Paul,

This note is a bit late! Family commitments, etc., have caused me to fall far behind, with e-mail reading, etc.

I constructed a 841/841 MOPA, years ago, that I used during the first couple of BK events, that I participated in.
(The 841 was a rather obscure high mu variant of the 10/210. I found a source that sold NOS 841s for fewer $ than used 10s were selling for).

I had planned to key only the PA stage, while allowing the oscillator stage to be enabled as soon as the T/R switch was thrown to the xmit position. Break in capability wasn't a requirement, and this was the simple scheme that I had always used in the past with various hb HF xmtrs.

To my surprise, the 841/841 xmtr actually chirped more, when doing this, as opposed to cathode keying both stages together! This despite the use of a stiff, dedicated B+ power supply rail for the oscillator stage!

My MOPA used grid neutralization, for the PA stage, which is considered to be inferior to plate circuit neutralization. Perhaps the imperfect neutralization may have been the cause of this counterintuitive result?

You may have a completely different result, Paul, especially if you do use an 865 tetrode in the PA stage. I will be keenly looking forward to reading about your experiments and results, with the 865 PA.

My reason for posting this info was to explain my suggestion that you may wish to try both options (PA alone vs both stages).

As for the BK recording, you definitely have my permission to use my transmissions. I will be looking forward to hearing what my signal sounds like, from way up there in Me!

Thanks very much for the QSOs on all 3 bands, Paul!!!

The countdown continues! Only ~ 350 days remaining (probably 357 for me, unless Murphy fails to find me, next year), until the next fun session begins!!!

Seasons greetings to all & vy 73 de Ron n4gjv

Between coils,
primarily? Or did you find other harmful coupling?

> keying can become a bit
challenging
> should you want to key just
one stage.

Indeed. Keying
is a nightmare and probably the biggest reason I kept
shoving the MOPA idea to the back of the
project queue. Although I
understand the
advantages of letting the oscillator run and keying
only the PA, that approach is not particularly
desirable as it will
have me scrambling to
completely revise my station setup with
respect to receiver and how to get some means
of hearing my keying.
I would prefer to key
both stages or just the oscillator but haven't
yet worked out the details of a suitable
arrangement. It has been a
while, but I
seem to recall after reading a number of relevant (or
not so much) articles I was still unsure how to
do this.

> not to
mention the ads
> associated with getting
HV to both units.

My
thought was to run completely separate power supply
umbilicals to
each board.

However, your comments have
got me thinking about my proposed
approach
to the MOPA again. I have a couple more weeks of rush-rush

trying to complete other projects and
sweep/push/shovel/drag/muscle/haul/bulldoze
them out of the way. :)
  After that
perhaps I will revisit the MOPA idea, do some reading
and breadboard something up to see what issues

I run into!

Ramblings
from my past thinking...

I
had planned to place the PA board to the left of the TNT MO
board,
since the TNT output is on the left
side.

For a time I had been
all about making the cleanest signal possible,
which in my feeble mind more or less translated
to running the
oscillator lightly. Hence
the idea of assuring maximum efficiency of
power transfer from MO to PA was born. I
thought about keeping the
TNT swinging
antenna coil, running twisted pair from the TNT antenna
connection to another link coupled to a PA grid
coil which would
have a variable condenser
across it to resonate the grid circuit. I
suspect this could be made rather efficient and
allow for adjustable
coupling. However I
eventually scrapped the idea because it seems
overly complicated and (primarily) because I
couldn't find any 1920s
examples of
this approach. By now you know how I am. :) If I can't

find a 1920s example, it's not
happening! This is purely a matter of
personal choice.

My revised plan called for removing the TNT
antenna coil and using a
simple coupling
condenser from the hot end of the TNT tank coil to
the untuned PA grid. Most likely I would mount
the condenser on the
PA board and use a
flying lead with clip to attach to the TNT tank.

In either case the PA plate
tank coil would be a foot or more
distant
from the MO plate tank coil and could be placed at right
angles to it if coil-to-coil coupling is an

issue.

I am probably
overlooking a number of nightmarish details.

73,
Paul

I spent the weekend testing several different style of modulators. Mostly on my ARC5.Some tests were good , some lacked something. during the night I was thinking about our self excitied osc ers and the problems that arise when trying to modulate. I am not whining because I have had several very successful attempt but sometimes a bit of FM creeps in. It is more often caused by the operators handling of wires (hand capacity etc)that go into areas that are RF determining areas then any particular relationship to the type of modulation tried. In that vane I arose this morning fired the 40M TNT and tried lacing the carbon mic away from me and speaking through a long cardboard tube to it. Basically replacing the wire going to the operator with a hose so to speak. It does work and in this case eliminated the problem. The mic however does not respond quite the same listening in a hose or tube as it does when being "spit"into however I don't think it is an insurmountable problem.

Hand capacity effects are a different issue from incidental FM and will cause a very different type of frequency change. When people discuss incidental FM, they are not referring to hand capacity effects.

Why does your microphone cause hand capacity effects? Are you using absorption modulation?

A pair of 852's in Class C telephony oughta be good for 120 - 150W. A single 849 class A Heising modulator would have no problem modulating that level. (I just consulted the RCA TT3 to make sure I knew what I was talking about).

Not QRP, but not quite QRO, either. (Yes Lou, I knew you were being facetious.)

Don,

You always have creative solutions to problems we see a lot using our 1929 rigs. I'd like to understand more about the results you are seeing.

You say "sometimes a bit of FM creeps in. It is more often caused by the operators handling of wires that go into areas that are RF determining areas" and then after using the cardboard tube (great creative idea, by the way) "in this case eliminated the problem".

- Is the problem you are talking about a shift in your unmodulated carrier frequency as you grab for the mike or a frequency shift during modulation/speaking (FM)?

- How are you checking for frequency shift of your unmodulated carrier?

- How are you checking for frequency shift while you are speaking?

Thanks,
Niel - W0VLZ

Thanks Don. It was my pleasure to work you and make recordings. I wish now I had spent a little more time saving sound files during the BK. Oh well, the Linc Cundall is coming up next month and a lot of people use their 1920s rigs in that one too. I managed to get the files I have permission to use posted to the web site today, in amongst other projects. I would give the web address but every time I do Yahoo throws a hissy fit and throws it in the spam trap where the group moderators have to deal with it. :-(It's my callsign dot com and follow the menu to Station, then Vintage, then Vintage Radio Sounds.

Hi Ron,

Thanks for the note re your MOPA experiments. I am behind on correspondence also. I seem to have more projects than I can count.

My plan is to do the UX-210 > UX-865 MOPA. I assume (which I should never do!) the tetrode will drive a bit easier than another UX-210. One of my goals is to keep the required drive as low as possible which should maximize signal quality. I do have another UX-210 so I might try that tube in the PA also.

When operating with the TNT and my DX rig as a receiver, I do use full break in. I like it, which is the reason I prefer not to leave the oscillator running. I will try keying the oscillator alone, and both stages. I'm sure as a test I will try keying just the PA as well.

It was certainly a pleasure (as always!) to work you. I wish I had recorded your signal on 160 meters, but I didn't. Thanks for kindly allowing me to post the recordings of you! They are up on my web site at n1bug dot com (Yahoo gets upset when I try to post links here on the group). Your '29 rig always sounds incredible! It is almost like a modern signal.

347:00:45:10 until the next running of the BK! Tick... tick...

Seasons greetings to all!

RCA made a broadcast transmitter that used a pair of 860 tubes modulated by a single 849. The 860 tubes are common and cheap now, so they would be a good substitute for the 852 if one wanted to build a higher powered 1929 style phone transmitter.

That broadcaster transmitter was pretty complex, but RCA also made a simpler high frequency MOPA transmitter that had one 860 tube as the master oscillator, two 860 tubes as the power amplifier, two parallel 849 tubes as the modulator, and one 203A tube as the speech amplifier. This would make an excellent 1929-style phone transmitter.

Perhaps comparatively cheap and common would be a better way to put it. The 860 was used extensively in military transmitters and also in broadcast equipment, whereas the 852 was only used in amateur and experimental equipment.
One has to wait around until a reasonably priced tube shows up. A year or two ago, when I was buying tubes for a transmitter project, I was able to get two NOS 860 tubes on ebay for an average of $25, within a few months of waiting. I have seen many sell for between $20 and $50.

In contrast, a NOS 849 set me back $170. However, it does put out a good 135 watts of audio in class A with 3000 volts on the plate if the grid is driven somewhat positive, which seems pretty impressive to me. Some people will pay $50 for type 45 tubes which can only muster a couple watts.

Don,

It has been a while and memory has faded somewhat. Back in my high power VHF/UHF SSB/CW days many of us were poor and there was a lot of talk and some articles about using oven transformers. Seems like at that time (I suspect it hasn't changed much) most were 800 to 1200V with maybe a very few reaching 1500V. I'm trying to recall details, but there was something about magnetic shunts that had to be removed for transmitter use. Darned if I can recall the reason now but the articles went into it in some detail. Seems like it might have been the shunts cause the transformer to draw very high current and run unacceptably hot when a transmitter is at idle, not drawing much current? I'm not positive that was the reason but it sounds right. I wish I knew where those articles are now, but I didn't find any of them on a look through the big army filing cabinet. Hopefully someone with a better memory and/or more recent knowledge can shed some light on this for you.

It sure is a pretty tube.

It's either pretty or pretty hideous, depending on one's perspective. I'm on the fence. :-)

I've seen a few good deals on 860 tubes also, but passed them by. One does have to wait as the $100 range is more common on ePay. I saw one and only one UX-860 a few years back, which I bought for more than I could really afford. It looks OK and the filament is good but I haven't tested the tube yet. There may have been more since then. I'm not sure I want to know. I haven't been in a position to spend anything on this aspect of the hobby in a long time and stopped looking because it was torturing me!

I would like to find another UX-865 or two, but have only ever seen the one that I bought. It looks well used and I'm hoping it has some life left in it. I know Jon said they show up, but probably during the time that I didn't have money and wasn't looking.

73,
Paul N1BUG

Thank you both. Magnetic shunts I understand well. They were used by Olds in starters during the hi compression days (10 and 11 to 1)to over come that initial grunt and worked by the way quite well. I can see where they might have application in a microwave. I realize they are not perfect but I don't need a KW. 200watts would be wonderful and a bit more a bonus. As far as overheating when left on Idont run my HV transformers continuous on my amps anyway so I should be Ok. I use a separate heater transformer which runs constant but I switch the 120v line to the HV transformer when transmitting. It has worked well so far. I think I will put the units on a 12 or 24 volt transformer and measure first. long term project anyway. I see on the web lots on both sides of the fence. Of course for me I always pay attention to one who has actually done it. I didn't find any real life horror stories so far. Would have been fun to read Manfreds before translation. A lot gets lost in the process!. Speaking of AMPs Santa also restocked my supply of hi voltage bypass caps and I repaired my Twin 811A amp and have it back in operation.
Getting ready for the Linc deal . Building a 117P7 single tube self supplied TX PTO tuned and probably Colpitts design although I can switch it still if I change my mind. 117P7 is according to my records 1941.

Interesting idea. I often thought that is what my DX60B needed a dual 6146B adapter. Not 1930s but same idea. To that end I have built two 3e29 tubes with octal bottoms wired for 6146 pinout adapted (soldered and glued) but never had the nerve to try them as I don't want to kill my rig. In fact the 3e29 probably wouldn't give much anyway like a pair of 6146Bs . I had surmised because the rig is controlled carrier and spends so little time at full throttle and because I am not capable of an old buzzard transmission the power supply could stand it most likely. Certainly for a quick test.
However now I think a device pairing a pair of 45 tubes could be popped into one of my 01A rigs for a real gain in power. Heater voltage if seriesed would be right, Bench PS can easily handle it as it is used for many such deals anyway. Power out should be a substantial increase. Stay tuned, this may happen.

Hi Paul,

Thank you very much for posting the audio files, and for the complimentary sig report!

I did a bit of review type research on the 865 tetrode, and I thought that you might be interested in the findings.
IIRC (and sometimes I do), the ST 865 physically resembles the 807. The comparison ends there, as the power gain of the 807 is somewhere in the vicinity of 250+, when operated in the class "C" mode, vs a power gain of only 16 (best case scenario), for the 865!
This realization provided me with a little insight regarding what a great breakthrough the pentode, and beam power tetrode designs actually were, compared to the (non radial beam) tetrode technology, that was available, in the days of yore!
The other shortcoming, of the 865, is its poor plate conversion efficiency, which is stated to be only slightly over 50% (best case scenario).
The 10/210/841 has a power gain of only ~ 6, so on the surface, it appears that the 865 may be a better choice, with regard to power sensitivity.
However, I noticed that an 801 etc, has a power gain of 15, when biased to operate in the class "B" mode. And, its efficiency in class "B" is substantially better than the efficiency achieved by the 865, in class "C"!!
It appears that the 210 can yield more net power output, for a given amount of drive power.
On the other hand, AFAIK, the 865 can be purchased for substantially fewer $ than the 10/210 can, and therefore may still be of interest to those of us that have a very thin budget.

I had explored some of this, some years ago, but I did not research the possibility of operating the 10 in the class "B" mode, at the time.
Enough of my rant! Excuse me, but I find this "stuff" to be interesting, so I tend to get "carried away"!
73 & HNY to Paul, and anyone else, that may have read this far!

Hi Ron,

Thanks for the note re your
MOPA experiments. I am behind on
correspondence also. I seem to have more
projects than I can count.

My plan is to do the UX-210 > UX-865 MOPA. I
assume (which I should
never do!) the
tetrode will drive a bit easier than another UX-210.
One of my goals is to keep the required drive
as low as possible
which should maximize
signal quality. I do have another UX-210 so I
might try that tube in the PA also.

When operating with the TNT
and my DX rig as a receiver, I do use
full
break in. I like it, which is the reason I prefer not to
leave
the oscillator running. I will try
keying the oscillator alone, and
both
stages. I'm sure as a test I will try keying just the PA
as well.

It was certainly a
pleasure (as always!) to work you. I wish I had
recorded your signal on 160 meters, but I
didn't. Thanks for kindly
allowing me
to post the recordings of you! They are up on my web
site at n1bug dot com (Yahoo gets upset when I
try to post links
here on the group). Your
'29 rig always sounds incredible! It is
almost like a modern signal.

347:00:45:10 until the next
running of the BK! Tick... tick...

Seasons greetings to all!

From: Jon Delventhal
Topic: 10162 Message: 10550

Ron,
I do not think that the class-C plate efficiency of the 865 that is listed in the data sheet is realistic. Last time this question came up a few years ago, I built a circuit using an 865 tube and measured the efficiency:

Plate voltage 750v
Plate current 60mA
Screen voltage derived from plate voltage with a 45k series resistor.
Grid voltage -105 volts from grid leak resistor
Grid current 7 mA

On 80 meters, the output power was about 31 watts (which is 69% efficiency), measured by checking the voltage across a dummy load using an oscilloscope. (I don't have a fancy wattmeter). The dummy load was capacitively tapped directly to the PA tank, not inductively coupled. A fairly high-impedance tank circuit was used to help maximize efficiency.

The plate efficiency of true tetrodes will not be as great as triodes, because the plate voltage cannot swing below the screen voltage, but they are not as bad as shown by that data sheet.
Jon

Not me, I was never lucky enough to come across one. Except in a friends barn several years agol and now he can't find it. :-((He's a good ham and vintage radio enthusiast, so I'm sure it didn't get chucked - at least not by him). There is no way I can or will pay the going price for one now. I heard early use of the '50 in RF service prompted the development of the '10, as the '50 was designed only with audio service in mind. Of course that didn't stop hams from using other audio tubes for RF ('42, '45, '46, '47, '71, 2A3, 6F6, 6L6, 6V6, etc.)

I know listmember Jon AB9ZG has, though, as he used one as a Heising modulator in a MOPA rig Bruce W1UJR now has. I helped Bruce to test out that transmitter about a year ago (or was it 2 years ago?), but we could only fire it up on CW, as we had no '50 available to us. That is one beautiful transmitter, BTW.

Hi Don,

That surely qualifies as being one of the weirdest Ham radio stories that I've ever been privy to...!

I wonder if the radio inspector took a look at the actual DATES that you guys were issued the same call signs, & that Derick maybe preceded yours on the calendar...? Hence the nod for VE3LYU being directed toward him...?

Some 30 years ago I ordered up a batch of QSLs from the USA, and when they arrived, the printer had inadvertently printed my call sign on the front of them as VE3QUI, rather than VE3CUI. He was nice enough to print me up a correct batch, & accepted the return of the'QUI cards---he probably ended-up using them as samples for his business...

Here they are. I was licensed in mid 1981 and operated well into 1982 before we bumped into each other on air. Derrick wouldn't send me the QSL until i got it fixed. His note says VE3LYX (was VE3LYU) so he wasn't giving up his turf. He was very upset at first until he finally realized it wasn't something I did. it was simply a clerical error.
don
I don't collect QSL much nowadays but looked through what I have from my first year or so. All but two are to VE3LYU. I did a lot of 10M Dx after I got my 6 months permission slip and even after I got my advanced ticket.
Don't hardly go there anymore. Why I don't know.

Hi Don,

That's surprisingly small & petty of Derrick to have behaved like that...but as I said earlier, I have little doubt but that the RI looked at the issuing dates of both issuances, & his most likely preceded yours. What other reason would there have been for the inspector to rule in his favour, save for "...first past the post," right...?

I continue to enjoy filling-out, and receiving, QSL cards here: in fact, I 100% QSL ALL DX contacts that I make here---have done so since first getting licensed in April(?) of 1971, and continue the tradition to this very day.

I know, I know: it costs money, takes time, is expensive overall, & it's a foolish thing to do, considering we now have eQSL & LotW...but y'know what...? To-day, we also have computerized extensions of radios, on-line DX spotting & chat rooms, roofing filters, surface-mount construction, etc. etc. etc. So why is it that we continue to indulge ourselves with hardware, & tubes, using technology that preceded the coming of The Great Depression...?!

Because it's fun, it's nostalgic, it's TRADITIONAL.

END of argument!

Larry,
I'm pretty sure I asked Bruce if he had the required tubes. I would have included a 50 if I knew he needed one. Were you able to get the transmitter working correctly?

I have purchased 4 globe 50 tubes on ebay for an average of $55. One of them tested "marginal," but still puts out full power audio in class-A. The key to getting tubes on ebay for cheap is to have them email you when a tube of interest is listed, and then enter a snipe for that tube with a sniping tool. You don't usually win but sometimes you do. This method has not yet worked for me with 851 tubes, however.

Don,
A type-50 will put out close to 6 watts of audio in class-A when given 500 volts and 50 mA. I have not tried them on RF because they have a bad reputation for RF and because they are more expensive nowadays than 50-watters. I also worry about using oxide filament tubes for RF since the emissive surface is more readily damaged by overloads than thoriated tungsten filaments, especially if they have a low plate resistance like the type 50.

Jon

don _

Not me, I was never lucky enough to come across one. Except in a friends barn several years agol and now he can't find it. :-((He's a good ham and vintage radio enthusiast, so I'm sure it didn't get chucked - at least not by him). There is no way I can or will pay the going price for one now. I heard early use of the '50 in RF service prompted the development of the '10, as the '50 was designed only with audio service in mind. Of course that didn't stop hams from using other audio tubes for RF ('42, '45, '46, '47, '71, 2A3, 6F6, 6L6, 6V6, etc.)

I know listmember Jon AB9ZG has, though, as he used one as a Heising modulator in a MOPA rig Bruce W1UJR now has. I helped Bruce to test out that transmitter about a year ago (or was it 2 years ago?), but we could only fire it up on CW, as we had no '50 available to us. That is one beautiful transmitter, BTW.

Hi Guys,

Can any of you recall receiving---and READING---the free-to-every-new-Ham publication that was once put out by the ARRL entitled, "YOUR NOVICE ACCENT"...?

I PORED over mine here when I got mine in '71, and the CW techniques that I learned from it, I use to this very day. It's a darn good read, NOW perhaps more than ever! An EXCELLENT refresher course in CW "style", too, if you need one...

If there's any interest, I scanned all 4 pages here---but they are of a very SMALL format (I'll NEVER master this stupid Apple iMac computer here!). Perhaps you computer gurus out there might know how to enlarge these into readable format, for benefit of all on-line. No matter, will be glad to send them all along, if anyone so desires...!

Hi Jon,

Thank you very much for the most interesting info, on the 865!
Your note inspired to look up the 865 data, in my old TT3 RCA xmitting tube manual. I apparently never researched the 865 data, via that source, before today.
This manual does not include typical operating conditions, only max ratings, for the 865. However, the data given for max ratings, very strongly indicates that the actual plate conversion efficiency is spot on, with what you measured, Jon.

This causes me to wonder where the uninspiring numbers, that appear in old handbooks and on Franks Electron tube pages, actually came from??

For the benefit of those that wish to put their 865's to work, the TT3 manual states that this tube should be mounted in a vertical position, only. They also go on to state that the screen grid, and the anode will show only a barely perceptible red color, when operated at max ratings--(3W for the screen grid, and 15W for the anode). This would presumably be a reasonably good indicator of the plate conversion efficiency, for those of us that have a dearth of test equipment.

This sort of info is not included on the usual data sheet, so I thought that I would pass it along, for those that may be interested.

Thanks agn., Jon!

HNY/vy 73 to all,

Ron n4gjv

Ron,
I do not
think that the class-C plate efficiency of the 865 that is
listed in the data sheet is realistic. Last time this
question came up a few years ago, I built a circuit using an
865 tube and measured the efficiency:

Plate voltage 750v
Plate current
60mA
Screen
voltage derived from plate voltage with a 45k series
resistor.

Grid
voltage -105 volts from grid leak resistor
Grid current 7 mA

On 80 meters, the output power
was about 31 watts (which is 69% efficiency), measured by
checking the voltage across a dummy load using an
oscilloscope. (I don't have a fancy wattmeter). The
dummy load was capacitively tapped
directly to the PA tank, not inductively coupled. A fairly
high-impedance tank circuit was used to help maximize
efficiency.

The plate
efficiency of true tetrodes will not be as great as triodes,
because the plate voltage cannot swing below the screen
voltage, but they are not as bad as shown by that data
sheet.
Jon

LC! I hope to CU there!

Bruce had the UX-210's - we borrowed them from a 160M PP TNT made by W2AO that Bruce had bought from Stu. He didn't have any '81s, so we made some solid-state plug in replacements in order test the transmitter on CW. Neither of us have/had any '50s.
> Were you able to get the transmitter working correctly?
Yes, it fired up fine on CW, both in Hartley and Xtal-controlled "modes." We loaded it up to around 20W into a 50-ohm dummy load, IIRC.

OK. I don't really do Ebay auctions, I've only won 2 total and that was about 15 years ago! I have bought non-auctioned items from Ebay vendors recently at a set price. I knew sniping tools existed, but other than that I know nothing about them.

Lost track of my days. It was the heavy metal deal. I have a fellow I was just talking to who has boxes of tubes and wanted to reduce so he had just a few popular ones to look after. I told him I could help him with that problem. I have gotten an NOS 45 , a 83from him. He has 15 PT15 tubes (Lanc Bomber supressor grid modulated finals). I will keep an eye peeld when I am there. No finders fee. Cover me or trade forward is fine. First I gotta find em. I was chasing him for a 26 tube which I KNOW he has.

Hi All,

This nostalgia thing is getting to me here, I guess...!

I was rummaging about the computer this morning, & came upon this jpeg taken of yours truly, from way back in 1972, after having been licensed for all of one year, or so...

This was my FIRST "operational" Ham radio set-up, taken in the basement of my parents' home.

That's my venerable old 3rd hand "Elmer" of a Hallicrafters S-77A SW receiver, with a HB 100-KHz crystal calibrator sitting on top of it. To the right is my transmatch, and the right of it---that darkened black-thing---is my HB 6T9 compactron transmitter (QST magazine, March 1971), with some sort of a SWR indicator affair atop it. The HB power supply---essentially lifted from a 1955 RCA TV set---is to the right of it.

Not the prolific use of "cake pan" chassis construction: I would "liberate" those proclivities from the kitchen, whenever my mother wasn't at home!

The chihuahua seated ever faithfully on the operating desk is "Rennie," a stalwart companion from my grade 5 days in school, all the way up to when I was working full-time, & ready to leave the family nest.

BTW, that black transformer seen to the left of the receiver was an isolation transformer that I had to incorporate with the receiver, because the S-77A was, after all, an AC-DC set: I used to get some horrendous jolts from the metal toggle switches, too, if I was operating in my stocking feet on the basement floor...!

Any, FWIW...are there any more photographic "...trips down memory lane" that others might wish to share on this eve before News Years Day...? Would LOVE to see them here...!

Hi Eddy
What a handsome looking young squirt!
Just to prove that I once was young also, here is a photo from 1964.

I still look the same, but the equipment has changed slightly. The SX-71 (which had just replaced a Heath AR-3) went away several years ago, and the DX-20 was given away last year. The Heath AC-1 antenna coupler was attached to the end of a random length end fed antenna that was stapled to the ceiling, and went out through a hole in the window frame and out to the barn. It did not work all that well but I sure had a lot of fun with that old junk!

Happy New Year to all and I hope to CU on the air.
Vry 73, Dave

misfortuneHi Dave,

Aren't those old snapshots just something we can (privately, at least!) revel in...?!

I recall here that I was SO very proud of my station, such as it was. Thinking back now, I was surrounded by guys running S-lines, Drake Twins, & Heathkit "SB" combos---yet, here I was, with a rockbound 8-watter, a 3rd hand receiver, & (in MY mind, at least) setting the Amateur world on fire.

Many a time I remember dashing upstairs, proclaiming to anyone who may have had the misfortune of being within earshot, "I just got Oklahoma...! Do you even KNOW how far away that is...?!"

I guess what pleased me the most was the fact that most of the set-up was homebrewed---I felt like Marconi musta felt like in HIS prime...!

It was a wonderful time, bar none. Thank goodness we had the foresight to document them with photographs...

~73~ de Eddy VE3CUI - VE3XZ

PS: Back in the day, I woulda KILLED to have a station like yours...!

I was first on the air as WN6ULH in 1967 with a BC342 and an Eico 720 feeding a base loaded vertical. Since then I have been WA5VLZ (Apr '68 - 2000) and W0VLZ (2000 - present). Neat radios through the years. Especially remember wandering down the hall in my dorm and finding a follow student with no/zero room on his desk for studying. His SX101 and HT32(?) took up all available space.

Unfortunately my schedule this year won't let me operate in the LC.

See W0VLZ Stations https://www.prismnet.com/~nielw/shack_tours/shacks.html for a rundown.

This was my second station and just after i had to change my call. I had figured out how to fudge the cards to a VE3LYX from LYU and I think that is the first one i did on display which is why I had the photo taken. My TS830S is there and i still have and enjoy it. beside it is my first homebuilt amp. Not visable but to my left is a complete DC3 (Dakota) radio with a tester supply under the bench. I still use this bench however the dark hair and the house are long gone. I weighed 243lbs and feared no man. I had a very good job then which is what bought the TS830S. I think the end of 1982 was when it was taken.

The UK mic arrived this morning.

Only near reference I have found is the No. 3 which is called out as a carbon.
Is a Carbon mic.?

Almost certainly, Lou. I'm not familiar with the specific microphone but
from the appearance of the housing and element it "screams" carbon.

Never wonder, hook it to your ohm meter and speak into it. The wiring may be a bit funny because it came from, "well you know" but I would be shocked if it isn't one. You need to find the pair that goes directly to the carbon element. Sometimes it goes though switch sometimes not. I am ready anytime Lou.

You need to find the pair that goes directly to the carbon element. Sometimes it goes though switch sometimes not. I am ready anytime Lou.

Hi Don,

Others have written directly with the opinion that it is a carbon mic. Like u say tho, just try it. I need a day to tend to other things. Thursday I'll make loop modulation my focus.

Will be in touch, Lou

This one is not too old, and does not show any equipment, but, it is from 1982 when I was just 37. I am the one with the beer in my hand and the dark beard, and the one with the cigarette is my friend Butch, W4HJL. This was at our Manassas, VA field day site where we used my N4FS call. I too have changed considerably in the last 32 years. My hair and beard is all white now, and, I am considerably heavier, HI. I'll post some real early photos in the future. 73 & all the best for 2015 - Mike

I am envious of you old geezers (at least Eddy anyway hi hi) who have pictures of themselves and their Novice stations. I can't believe it but I don't have a single picture of my Novice station or me at the station. The Novice station was a Knightkit T-60 and National NC-183. To me it was one of the most amazing stations ever. Like others said, I'd also run upstairs and bother the family when I'd work the Canal Zone or California. Not much has changed though as just recent I worked a new country and ran upstairs to tell my wife and daughter who feigned interest but couldn't care less. har har

I've been doing Boatanchors since 1994 and trying to recapture the magic of those early QSO's with the T60 and NC183. I've come pretty darn close with my Johnson Viking Valiant and 75A-4. It was magic when I fired up the Valiant with those 866 mercury vapor rectifiers glowing bright blue like a nuclear reactor and I made my first QSO's.

I only have 1 photo of my General station consisting of the HX-50A and HQ-180AC, and a poor picture it is.

BTW I've been a ham for around 46 years getting my Novice in 1968 I think. It shocks me to think in numbers that high. Yikes.

A pair of 7034s(4cx150a) I never got to use it on air because VA3UZ Yuri saw it after it passed the smoke test and gave me real "pictures of the Queen" for it. By then I had reboxed it in a larger stronger cabinet complete with its power supply with the old 330v photoflash caps. He was here buying my A3 beam after I'd moved and just kept offering till I caved. Must have not been too bad. I never heard any whining. it was my first amp although I had built lots of RXs before. As a pre driving teenager I used to spend summers building kit lab stuff for short run testing. usually Eico. Signal gens , both RF and AF VTVMs and stuff like that. My Dad got me into that and I never had to fix one. He said it was good experience and lent me out for free. I guess it was but a little gold wouldn't have hurt.I am not like that now!. I am lucky to attach a power cord properly. Frustrates me to no end. Also on the table there but not in the picture is a solid state 2M amp I built. It worked quite well. Got the design from the 81 or 82 handbook. When this pisture was taken I had sold my specialty tune up business Power Tune Up (Belleville) Ltd and gone back as Service Manager at ashop i had worked at in the 70s. They were losing money and my old boss hired me to fix it. I did and he paid me very very well. In fact it would be Ok wages even today. So the Kenwood. I bought new and with my Christmas bonus alone that year bought myself a new car , cash. They were good years but it was a hard job and eventually I had had enough. The Kenwood though has stood the test of time and been a faithful addition to my shack. My first rig was Viking II CDC model borrowed from Bill Drulak VE3HBS and i used a DX200 (Eddystone wannabee) from radio shack for receiving. Liked the DX200 but to be honest I hated the Viking II with a passion. Don't know why but I did. Thing seemed like it weighed 300 lbs. Probably because there were no dials . It was like trying to QSO with your fridge. Didn't look like a radio to me. Also had the little VFO that went with it. .

Hi Mike,

Ah yes---Field Day & beer, COMBINED...! A marriage made in Ham Radio heaven, surely...

Still, it CAN have potentially devastating consequences.

I distinctly recall a FD early in my Ham career, held at the apple orchard of good friend (and now SK) Bill, VE3BRT: George (VE3GOU---also an SK now) imbibed in a tad more Molsons suds on-site, than he did CW, and VERY late on Saturday night, elected to go visit his girlfriend in the neighbouring town, in his (then) brand new 1973 Chevrolet Caprice. At the end of the tractor trail leading from the apple trees, was a 90-degree jog---the only thing that might keep an inattentive driver who missed this turn from driving right into the kitchen of Bill's place was well-placed wooden utility pole...

Well, you guessed it: WHAM...!!!

Bill & his XYL were rudely roused out of their slumber by the sound of the tipsy George crashing right into that very pole. Were it not for its presence, the front end of that Chevy would have been parked ring side at the breakfast table in 'BRT's kitchen.

It sure was a simpler time, just a few short decades ago. We all got a laugh out of the incident, & life went on. Everyone spent the subsequent years making more CW contacts...and drinking more beer. And then, suddenly one day, we all got older---and wiser!

Me too - the older and wiser I got, the more beer I drank. That is why all the extra weight since that photo, HI. Fun days those field days were. We had stations on all bands, mostly CW, but some SSB. Big generator running in the background about 150 feet from the first operating tent to reduce the acoustic noise.73 - Mike

Still, it CAN have potentially devastating consequences.

I distinctly recall a FD early in my Ham career, held at the apple orchard of good friend (and now SK) Bill, VE3BRT: George (VE3GOU---also an SK now) imbibed in a tad more Molsons suds on-site, than he did CW, and VERY late on Saturday night, elected to go visit his girlfriend in the neighbouring town, in his (then) brand new 1973 Chevrolet Caprice. At the end of the tractor trail leading from the apple trees, was a 90-degree jog---the only thing that might keep an inattentive driver who missed this turn from driving right into the kitchen of Bill's place was well-placed wooden utility pole...

Well, you guessed it: WHAM...!!!

Bill & his XYL were rudely roused out of their slumber by the sound of the tipsy George crashing right into that very pole. Were it not for its presence, the front end of that Chevy would have been parked ring side at the breakfast table in 'BRT's kitchen.

It sure was a simpler time, just a few short decades ago. We all got a laugh out of the incident, & life went on. Everyone spent the subsequent years making more CW contacts...and drinking more beer. And then, suddenly one day, we all got older---and wiser!

Hi Scott,

What was your Novice call-sign...?

I have very fond memories of the USA Novice days, & spent a lot of my time hanging out there with the 3, or so, JAN crystals (Fort Myers, Florida) that I had which would allow me to do so. It was just exactly like being with a "...band of brothers": everything in the new & exciting world of radio was wonderful, & it was great sharing it all with kindred souls.

One thing that I especially loved to do was being "DX" to the many American Novices on 40-meters: I'd hear a strong Novice calling a lengthy CQ, and then I'd answer---and I swear I could see the guy in my mind's eye, squirming in his seat in front of his key, and bewildered as to the non-"WN" prefix of the station calling him. The frequency would suddenly get VERY quiet. Was it legal to work a "VE3" station...? Where exactly IS "VE3," anyway...? Etc. etc. etc.

Or I'd call CQ on a clear spot on 40, and 4 or 5 Novices "...in the know" would all rush back to answer me, piling on top of one another!

What great sport---and what an ego booster for me, too, to be told that I was some guy's "...first DX ever!" in Ohio! It sure made me proud of what I had accomplished with that 6T9 compactron tube rig of mine, I can assure you...

Hi Mike,

Field Day was also an opportune time to indulge & experiment in some fanciful antennas, too...

During my stewardship over 40-meters CW during the years, we employed:

---A 2-element parasitic delta loop;
---A 1000-foot(!) long wire;
---A 4-element(!) parasitic delta loop;
---A Bobtail phased array;
---A 2-element phased delta loop array;
---A 300-foot tall(!) kite supported vertical.

And that's just what I can remember, too (must be the beer!).

> A pair of 7034s(4cx150a) I never got to use it on air because VA3UZ Yuri saw it after it passed the smoke test and gave me real "pictures of the Queen" for it. By then I had reboxed it in a larger stronger cabinet complete with its power supply with the old 330v photoflash caps. He was here buying my A3 beam after I'd moved and just kept offering till I caved. Must have not been too bad. I never heard any whining. it was my first amp although I had built lots of RXs before. As a pre driving teenager I used to spend summers building kit lab stuff for short run testing. usually Eico. Signal gens , both RF and AF VTVMs and stuff like that. My Dad got me into that and I never had to fix one. He said it was good experience and lent me out for free. I guess it was but a little gold wouldn't have hurt.I am not like that now!. I am lucky to attach a power cord properly. Frustrates me to no end. Also on the table there but not in the picture is a solid state 2M amp I built. It worked quite well. Got the design from the 81 or 82 handbook. When this pisture was taken I had sold my specialty tune up business Power Tune Up (Belleville) Ltd and gone back as Service Manager at ashop i had worked at in the 70s. They were losing money and my old boss hired me to fix it. I did and he paid me very very well. In fact it would be Ok wages even today. So the Kenwood. I bought new and with my Christmas bonus alone that year bought myself a new car , cash. They were good years but it was a hard job and eventually I had had enough. The Kenwood though has stood the test of time and been a faithful addition to my shack. My first rig was Viking II CDC model borrowed from Bill Drulak VE3HBS and i used a DX200 (Eddystone wannabee) from radio shack for receiving. Liked the DX200 but to be honest I hated the Viking II with a passion. Don't know why but I did. Thing seemed like it weighed 300 lbs. Probably because there were no dials . It was like trying to QSO with your fridge. Didn't look like a radio to me. Also had the little VFO that went with it. .
> don
>
>

Hi Don,

Funny thing---I bought an old Viking II CC ("Continuous Coverage") from a Ham in London a few years ago, & I absolutely LOVE that big brute of a unique rig!

Mind you, as you say, it IS huge, and cumbersome to work on---but it's powerful, has excellent quality on both CW and AM phone, and it's rugged to the Nth degree.

Which reminds me: I really should get that ol' rascal up & running on 40-meters AM one of these days, again!

But I digress: I bought the V2-CC to replace the Ranger that I sold a few years earlier. The Ranger was a LOT lighter & a LOT easier to work on, but the V2-CC is a fitting replacement---and that "CC" moniker is a great conversation starter, as VERY few Hams are even aware that this THIRD derivative of the Viking II even exists (it was original made for the Royal Canadian Air Force, in 1962).

I still have a Viking I - almost the same rig as a (non-CC) Viking II, with a few notable differences. Aside from using a 4D32 instead of a pair of 6146s and no clamper tube, I find it easier to work on than the Viking II due to the rack-style cabinet and panel. I've worked on several Viking II's for others over the years. I like the Viking I a lot, although the one I kept has been totally "ruined" as far as any collector value goes. It looks good and sounds better, but the audio section is totally re-done with solid-state up to the modulator tubes, which are triode-connected 6DQ5's. I also have a Ranger, with somewhat less-radical modifications. (I used to have a second Viking I, but sold it at the NEARfest a couple of years ago in a vain attempt to downsize.)

Don, I don't get your previous comment concerning the lack of dials on the Viking II - from where I sit, it's got dials galore!

I can certainly understand that. It was and still is a very popular rig and rugged for sure. It just wasn't what I had envisioned in my mind. Probably with a Ranger I would have thought I was in heaven. So I don't want anyone out of joint because of what I said. It is just a memory I have from back then. To be honest I had no idea how to run it and had to learn by trying. Lot a knobs on that old rig. I remeber I asked Bill for the short cousre and he said ah plug it in you'll figure it out.Which I know understand means I am not really sure either. never tried it. But back then I didn't know thing like that.

Hi Don,

Well, with al of the dials & meter settings on that V2, it can be a tad daunting at first, no doubt about it!

But after a few trials, it all makes sense---just have to remember to re-trace your steps, to be sure you tweaked everything right-on. A FAR cry from to-day's solid state no-tune wonders, huh...?!

Now Ur talkin! I found a unit in an old article that had 13 carbon mikes mounted each in its own tube and the Op spoke into a common opening. It was to increase power handling. Practically though on a 1 tuber it works pretty good. And by that i mean pretty good like our TNTs Hartleys and TGTPs work pretty good. Certainly doesn't compare to modern stuff> however if we were back in the day say 1919 and had it we would feel like pretty "fart smellers." I don't know what the mod percent would be. I know from experiment you can have too much so you adjust the loops position to avoid that. Anywhere your sniffer works a loop will work BTW. I also have tried putting a rheo connected pot in series in the loop circuit to see if I could control it. And I could but the idea seemed superfluous when moving the loop a bit accomplished the same thing. I hope you get it hooked up soon Lou. I have been waiting a year for a loop de loop QSO. I have had a few QSO with it on my TNT though. It was a lot of fun. Long ones too! DX for a TNT. Best was with Dave W2VW and the group. They listened for me and heard me immediately. (He gave me a sked and when I fired up he said is that you Don?) I think they had as much fun as I did. Sure it is just a curiosity but it is also part of real old radio history and I have had a lot of interesting fun exploring it. I hope someone else on this earth will feel the same and we can have at least a couple of QSO a year with it.

It was fun to say the least.
I worked another fellow down that way a few days later (Don perhaps) as we were in QSo and he mentioned aside from his heavy metal big stuff he liked to play with one tube versions. I told him was was sitting in front of me and he said "put it on . I want to hear it". He was laughing when i finished. He said what was really funny was the TNT with loop mod was less then 2 S units under the DX60B driving the twin 811As. .
BTW seems to me it was Dave that messed up his foot last year working on the tower. Is that right? If so I hope he has recovered well. I certainly appreciate his efforts.
It isn't a perfect system but it is historical and it is FUN!

Hi Eddy et all,
My novice call was KN3IGT, and my entire novice "career" was spent on ~ 7198 Khz. That was the frequency that I was able to QSY (via graphite) a bargain xtal, that had initially been ground for a bit above 7200 Khz.
Like Scott, I also found a special thrill, associated with a "real DX" QSO with the occasional VE, that roamed that far up the band. This despite the fact that the VE3 border was only about 100 miles away, much closer than KN6 and KN7 territory!
The SWBC QRM was ultra fierce, in those days, from Radio Moscow (which simulcasted on many frequencies)and many other SWBC stations! I used to arise in the early morning hours, before going to school, to log QSOs with KN6 and KN7 land. The SWBC QRM was much less of an issue, at that time of "day".

73 & HNY to all!

I was on CW.
LIke
you, I had 3 or 4 crystals on 40 meters and that was it. I
sure wish I would have gotten on 80m. It would have been a
lot more fun in the evening when 40 meters was ripped up
with AM.
I've
been working on my 1935 Gross CP-100 transmitter for the
Linc Cundall but it's going slow. Something going on
in the PS.
Happy New
Year. 73, Scott WA9WFA

Hi
Scott,
What was your Novice
call-sign...?

I have very fond memories of the USA
Novice days, & spent a lot of my time hanging out there
with the 3, or so, JAN crystals (Fort Myers, Florida) that I
had which would allow me to do so. It was just exactly like
being with a "...band of brothers": everything in
the new & exciting world of radio was wonderful, &
it was great sharing it all with kindred
souls.
One thing that I especially loved to
do was being "DX" to the many American Novices on
40-meters: I'd hear a strong Novice calling a lengthy
CQ, and then I'd answer---and I swear I could see the
guy in my mind's eye, squirming in his seat in front of
his key, and bewildered as to the non-"WN" prefix
of the station calling him. The frequency would suddenly
get VERY quiet.
Was it legal to work a "VE3" station...? Where
exactly IS "VE3,"
anyway...? Etc. etc. etc.
Or I'd call CQ on a clear spot
on 40, and 4 or 5 Novices "...in the know" would
all rush back to answer me, piling on top of one
another!
What great sport---and what an ego
booster for me, too, to be told that I was some guy's
"...first DX
ever!" in Ohio! It sure made me
proud of what I had accomplished with that 6T9 compactron
tube rig of mine, I can assure
you...

The" tuffest challenge" of all is getting anyone to seriously try the loop. I often wish it had not been me who figured out how to make it work properly.(New guy syndrome) If it hadn't been for Tim VE6PG, Dave W2VW ad Lou VE3AWA who had the guts to try it with me I would still be QSOing with Scooter the cat. Anyway tis what it is. Too much fun anyway.
The question for today is when did Pi network outputs come into use? The old style are or can be harmonic generators . The Pi does not seem to have that characterisic quite the same. My tuner is a Pi I built myself and would handle a KW easily. I run my TNT through it because it ensures a decent clean signal. I don't think it was around in the 20s or even the 30s but have been unable so far to get a handle on when it came into vogue.

Hi Lou,

We found that the band switch works best when turned clockwise!

That sounds to me like a a slight application of castor oil in the switch rotary mechanisms is in order...

Had that same trouble here once with a high-voltage Centralab-brand ceramic rotary switch that wouldn't always positively lock into position every time. The castor oil cured that ailment PDQ.

It shows up in the 1935 Radio Handbook on page 113 and referred to there as a “Collins Pi Coupler”. It also appears on page 116 of the 1935 Radio Amateurs Handbook. I did not see anything in my 1931 handbooks. Perhaps look through some academic, industry, and IRE literature of the period if you have more than a passing interest.

Hi Guys,

I wonder: can ANYONE find a picture of Ed Handy (W1BDI) anywhere on the internet...? I give up here!

However, in my search, I DID come across something pretty neat: the complete download of the classic book, "FIFTY YEARS OF ARRL" i.e. a bound reprint of the series that was in QST every month in 1964...

Well worth looking at, IMHO.

Well since you brought it up. I was trying to let it go but I am only human.
First 100% modulation is not necessary for good communication. 40% is quite acceptable and it can be done on less. A lot less. In 1919 ANY voice on a radio signal would have been wonderful. 100% is the standard to shoot for perhaps and some want 100+. That said I have had too much and had to back off the coupling.
Secondly to expect a system like that to be perfect is not reasonable and to try and apply modern standards to it is "less then fair".
Your (our)TNTs Hartleys etc don't have perfect signals or even close and this is from that era. So the same standards should be applied. Does it work? Yes. Is it usable and fun? Yes. Punkt.
Thirdly if you need a KW to enjoy radio you have a problem. A good 150W with a good antenna will get you most anywhere. 5 watts will easily get to the east coast from here. CW or Loop phone as some of you who double checked on me already know.
For most getting out is not the deal. Hearing or RX is the problem. I listened to a KB3Y something last night who was calling CQ for hours and getting replys but obviously didn't hear them.
Fourthly I use solar window heater(my own invention) here to keep warm but they are also a passive device costing little, capable of heating the whole house in even moderate sunlight but like the Loop are so simple that no one would try them anyway. However what I save on heating with them goes into my European trip funds (thousands of $$$$).

fair".
Your (our)TNTs Hartleys etc
don't have perfect signals or even close and this is
from that era. So the same standards should be applied. Does
it work? Yes. Is it usable and fun? Yes. Punkt.
Thirdly if you need a KW to enjoy radio you
have a problem. A good 150W with a good antenna will get you
most anywhere. 5 watts will easily get to the east coast
from here. CW or Loop phone as some of you who double
checked on me already know.
For most
getting out is not the deal. Hearing or RX is the problem. I
listened to a KB3Y something last night who was calling CQ
for hours and getting replys but obviously didn't hear
them.
Fourthly I use solar window heater(my
own invention) here to keep warm but they are also a passive
device costing little, capable of heating the whole house in
even moderate sunlight but like the Loop are so simple that
no one would try them anyway. However what I save on heating
with them goes into my European trip funds (thousands of
$$$$).

10650. 2015 AM TRANSMITTER RALLY

Yahoo group: AWAGroup (2014 — 2016)
Date: 2015-01-05 18:39:06 UTC
From: Ron Barlow
Topic: 10650 Message: 10650

Hello all,
I believe that many of you also subscibe to the GB list. For the benefit of any of you, that do not, I thought it worthwhile to forward this posting, by Brian, AF4K, from that list.
73 de Ron

2015 AM Transmitter Rally
Saturday, February 21st 1100 UTC to Monday, February 23th 0700 UTC

Complete information & rules are available at http://amfone.net/AMTR/AMTR-2015.html

Just a friendly reminder that the 2015 AM Transmitter Rally will be coming up in February. Use your vintage or modern AM gear for AM to AM QSOs. Low or high power, new or old gear, fire up for the AM Transmitter Rally! Renew old acquaintances and welcome newcomers to AM. Please
spread the word among your AM friends!

The AM Transmitter Rally is sponsored by: AMFONE (http://www.amfone.net) & Radio Engineering
Associates (http://www.radioassociates.com >)

Let me know if you have any questions.
73, Brad K4RT

Hi Guys,

I believe somebody here once said that VE3UR was an Elmer of sorts to them, early in their respective Ham career...? Don, was that you, maybe...?

In any event, here's an old VE3UR QSL card, from back in the day.

10653. Dual tube

Yahoo group: AWAGroup (2014 — 2016)
Date: 2015-01-06 22:49:17 UTC
From: dulmagedon@...
Topic: 10653 Message: 10653

I have been working on my original HB transceiver the last couple of days. Screen modulated two tube tx with a mated two tubed regen. I had great success today getting power up to usable levels (7+ watts out.)and improving the modulator in a couple of places. 80M ad 40m were crap today so when I finished so early I took that 3e29 (mil 829B) octal adapted tube I showed last week or so and replaced the 6146B in one of my HB Am transmitter projects. I am not using that rig nor do I intend to (20M AM (14286)is only used by two people in the world and on any given day usually one of them is sick) and decided it would be the be guinea pig for the test of the adapter tube. Did it work? As a matter a fact YES!

For what it's worth, Lou's eBay links always work for me. One click and I'm there. With an item number I have to select the number, copy, open a browser, go to eBay, paste. Lot more work. Which is probably good as I would pass over most of them instead of looking at stuff I want but can't afford to buy. ;-)

Don,

There are a bunch of guys on AM around 14.330 MHz on Monday nights starting at 8:00PM eastern. Propagation is better in the summer of course, as 20M shuts down earlier in the winter months.

10667. Old TRF to ham station.

Yahoo group: AWAGroup (2014 — 2016)
Date: 2015-01-07 14:48:53 UTC
From: dulmagedon@...
Topic: 10667 Message: 10667

I keep looking at these old TRF sets. I have several. Two are really good but a couple are "Iffy" on their best day. I often thought everything is there to build a complete ham station. One could easily convert one of the early stages to a TNT or even a TGTP and seperate its output to an antenna. Another stage could easily become a regen and the audio output stage is already there. One sure wouldn't want to ruin a good radio but rewinding a few coils and rerouting some bus wire should do it. It must have been done back in the day. It is just too obvious a challenge. I have a King Neutrodyne here that may get sacrificed on the vintage ham radio altar. It has a bum litz wire coil and its cabinet will never be great.And of course to other no one would even know.. Keying(ad here a mic) can come out the back hole leaving the radio intact visually.

It certainly *was* done, Don, but probably not very much until the
1930's when these old battery-run 3-dialers were obsolete and had lost
much of their value. There was a Short-Wave Craft article which was
reprinted in Gernsback's "1934 Official Short Wave Manual" on p32-34 of
that publication by Louis F. Leuck, entitled "Making a Short-Wave
Transmitter from a Neutrodyne." The transmitter described uses a '01A
Hartley driving a '12A PA, Heising plate-modulated by a '71A, with two
transformer-coupled '01A stages between the carbon mike and the '71A grid.

As I have mentioned here before, I have an old 3-dialer carcass here
waiting for me to get around to such a project.

Beautiful job as always, Lou! Ah shucks, thank you Larry.

Last part I need for this TPTG Depression Rig project.

Small rheostat dial akin to "C1"? Does not have to be exactly as shown, but like in having a scale. Could be 50-0, 0-100 etc.
Maximum dia., 2" with 1/4" shaft hole, but if hole smaller, we'll talk.

(Tim, Scott, pse note that the Depression started, Oct., 1929)

I plan to start today if all goes well. I am going to free style it. But all vintage circuits..
Plan is two sections (two dials) for the transmitter and the rest will be a regen with audio output which is already all built and working in the original radio. Modulation will be , well, you know and percent will be adjustable. Plan is to run the osc at around 100 volts and the PA at 180v at least. Couple "not to tight" and hope it doesn't pull on keying. The regen will run on same voltage as osc does. I am going to do a 40/80M I think as the tuning range of those old varcaps will allow that without switching of changing coils. . (I have three such beasts already) I would do a 160M but can't afford the wire for that long an antenna ;>). I may borrow my wife's camera and picture the conversion. I have had a great week in the shack reworking old projects finishing yesterday with my 20m hb screen modulated rig . If it passes the hi power test today then I am caught up and can start on the Neuamateurfunkmachine from a Neutrodyne. I would like to run it battery power although Ihave acquired a 1927 Majestic light socket battery eliminator in working condition.

Hello Larry,Carl, and others,
I've seen that article on how to make a "fone rig" from an old TRF Neutrodyne from the 1934 Shortwave manual and have always bee fascinated by it. I'd particularly like to try one on 160M to see how it worked. I've got the "Three Dialer" Neutrodyne donor rig I could use, the necessary tubes and probably all the parts I would need to build one. It would make for a FBOM depression 'fone transmitter!

Let me know how you make out if you actually start to build said transmitter. I'd love to hear it on the air and ideally have a QSO with you if I build one myself. I have the aforementioned article in the 1934 handbook and it doesn't look all that hard to build.

I hope you do Joe, I have started..Mine has two RF amps at the antenna amp. The last one will become my final and the next one in the osc.. Just need to reverse the direction. Reworking the coils especially the osc coil and the regen section (current detector stage will be from the looks of it the most difficult or confusing. I am aiming for 80M with hopes it wil cover 40M. 160M for me is a waste. I have a 160m commercial rig and it has never caught anything so I will pass on 160M. 80M has been very good to me from this QTH and 40m a close second. I have built quite a few regens and have learned how to make them work with no regeneration control. Whether this radios layout will cooperate with that or not we shall see but almost everything is already there except the regen feedback so it is a shame not to use it since i only need two tubes for the TX. Chances are pretty good that controlling detector filament will work as a regen is nothing more then an oscillator that is just under oscillation point. I will rewind its coil hartley style as I have had the most luck with that style without using a pot or throttle cap. I am loop moding my transmitter for when I want fone and percentage or depth of modulation will be adjustable. Have gotten pretty comfortable with this old system having spent the last year trying everything I could think of. . I busted my soldering iron last night so I am at a stand still till I go to town. And yes I am taking pics with the XYL camera.

I could only get one pic to load.Could be the dial up.Will try from a wifi location. Reworked the output coil. Will check it remounted with the GDO tomorrow. Also want to float the A circuit as it is in this radio one side grounded which interferes with my favourite Osc and regen designs. Hardest part is remembering What I need are the sockets, the coils and the variable caps. Anything else here as built is not important.

OK; once you're on a wifi connection you should have no problem.

The transmitting Hartley circuit you're using can easily be changed to
let one side of the filament be at ground. The receiving Hartley is a
bit more challenging to allow this.

You are exactly right Larry. The Tx could be modified easily but the rx might become unruly as regens are finicky lil beggers so I think I will just float the A and be done with it. It is not a metal chassis so it isnt a big deal anyway. I especially like building the hartley regens as they are not sensitive to hands and seem to have good manners and easy to control.

Topic: 10667 Message: 10695

It is the worst I have. The chassis is good but the cabinet is crap and it is the kind of crap that will never be any good from a collectors standpoint. Warped chipped and distorted so I feel no guilt. I have a perfect AtWater Kent 20 , a perfect Stark Metal Products one tube regen , a Consola chassis I had a cabinet built for and a Freuneden Schmitelheimer or something that works but doesn't lend itself well to mods, an original Radiola III-A that has a family connection. Besides when this is done NO ONE but me and you folks will know it isn't stock. Nothong externally will be changed and very little internally as well when all is said and done. I have the osc and the PA coils done and checked on the GDO. My GDO only goes to 2mcs but I still have lots of vari cap to go to full mesh so It would appear that I will have 160M 80M and 40M without switching. As long as I have 80m solid I am happy as I have the best results there with these rigs. However extra is nice. original coil was over 90 turns. I am at 18 now and it tunes te range. Probably 17 turns would be a bit better but since it covers all I am going to invoke "the cabbage rule" (quit while you're a head). The hardest thing for me is to make myself realize that I dont have to use any of the old circuits if I don't want to. A hartley osc , a RF PA and a hartley regen can be built in a few minutes each once the components are mounted and doing it like this they are. Gotta make a three RFCs. Two for the Tx and one for the regen. It is my goal to have a operational station behind the panel that looks as original as practical and still works well. Probably didn't need the PA but the three dials and coils are there so why not use them all. This radio is set up for a 1000ohm speaker and I have two of them. I have to beleive that early hams did stuff like this all the time. It is just too obvious.

Subject: RE: [AWA Group] Old TRF to ham station.

It is the worst I have. The chassis is good but the cabinet is crap and it is the kind of crap that will never be any good from a collectors standpoint. Warped chipped and distorted so I feel no guilt. I have a perfect AtWater Kent 20 , a perfect Stark Metal Products one tube regen , a Consola chassis I had a cabinet built for and a Freuneden Schmitelheimer or something that works but doesn't lend itself well to mods, an original Radiola III-A that has a family connection. Besides when this is done NO ONE but me and you folks will know it isn't stock. Nothong externally will be changed and very little internally as well when all is said and done. I have the osc and the PA coils done and checked on the GDO. My GDO only goes to 2mcs but I still have lots of vari cap to go to full mesh so It would appear that I will have 160M 80M and 40M without switching. As long as I have 80m solid I am happy as I have the best results there with these rigs. However extra is nice. original coil was over 90 turns. I am at 18 now and it tunes te range. Probably 17 turns would be a bit better but since it covers all I am going to invoke "the cabbage rule" (quit while you're a head). The hardest thing for me is to make myself realize that I dont have to use any of the old circuits if I don't want to. A hartley osc , a RF PA and a hartley regen can be built in a few minutes each once the components are mounted and doing it like this they are. Gotta make a three RFCs. Two for the Tx and one for the regen. It is my goal to have a operational station behind the panel that looks as original as practical and still works well. Probably didn't need the PA but the three dials and coils are there so why not use them all. This radio is set up for a 1000ohm speaker and I have two of them. I have to beleive that early hams did stuff like this all the time. It is just too obvious.

It is coming along pretty good. I guess as Kathode Mike says it is perhaps a bit rarer then my other ones however I am willing to bet no one has a regen like the Stark. But that doesn't matter. Stuff is never worth anything when you want to sell annyway so I gave up chasing that sort of stuff along time ago. There is a 426 MAX Wedge 63 Dodge sitting in my garage. If I went to sell it I would probably have to give it away. Also have an accordian made about 1888. Probably couldn't find anyone to give $10 for it. Got 8 violins(7 hand made) which probably at sale won't cover the cost of a decent set of strings. Never had any luck buying things because of value or rarity so I buy em cause I want them. I got this King radio at a flea market years ago. Tried to get the cabinet fixed but just wasted my money. At least I will have some fun with it now hopefully. One of the King Cardwells needs adjusting as it wont stay put. I have done that before so it is no big deal. It is in the detector section so will be the regens tuning. I am leaving that alone for now and concentrating on getting this lil Mopa section running . Finished the heater wiring rework. Moved the B- to ground only. and added a three turn link for output. Regen if it is any good wont need more then a few feet of antenna so I never run any of mine on the TX antenna. Wiring for the TX has been split off now. When I run a regen with a tx I always leave the heaters hot and switch the B voltage off the TX and onto the RX. That way heaters are always hot so either is ready to go in an instant but I don't have to listen to the osc or for that matter the PA should it decide to get stupid. Trying something with this Osc and PA using the originl components first. If it does not work it is only a few minutes to go to later 1930s stuff.

As a dial "stop" ? Maybe not the intended purpose but it -would- prevent going all the way round.

No they are bolt togethers. I already readjusted the tension screw and the problem is solved.
Also as of 5 minutes ago it is running! I recorded its second breath with my computer mic and the volume turned up on my KN TS830S nearby. AllI had was 70 volts (8 nine volts) and a six volt on the heaters supply system. I had 01As in both osc and PA and keyed PA only.OScis very loosely coupled to the PA and will run in the end at 90volts while the PA will run at at least 270. Both tuned well. Very distinct and sharpe. I am taking a break before tackling the rx section. Had only one minor glich in firing it up so I am happy.

Sorry I had a rundundant pic .This is what it should have been, Added 5 components and modified I other existing ones. New components are a gridleak assembly 680pf and a lemon resistor.(yellow multiplier) I am colour blind (severely) but its in the 200k area but doesnt really matter as long as it is more then 5k and less then 1 meg. For osc I like lower but for this one since I want it to feel somewhat on its own I chose this value. Cap is a 680pf punkinseed. OSC choke I wound on an spare core. Up top there is another similar choke (for PA tube) and a .003 vintage style cap in the P/grd leg of the osc . A reworked output coil of minmal urns repalces the original Antenna in link. A battery has been separated from the ground (B-) circuit. OSC gets its B- at bottom of coil cap tank and it gets to the heater cathode through the traditional style hartley cathode coil tap. Since the osc and PA heaters are tied the PA steals its grd from that as well. I thought it might bother it but t doesn't appear to. it seems to work well. Working out these deals with directly heated tubes is a bit of a headache but its is done and working. A bit of creativity , a sparkof an idea and a roll of the dice sometimes produces results. (Sometimes it doesn't but you always learn something regardless)
Some were asking about mopa with our tubes. This is one.

OH OH!
I am thinking now it would be fun to use it on the Linc Cundall deal. However time can be a big stumbling block when you have little. I haven't begun the regen section yet. I may have to fire up my ARC 5 station on 80M CW since both TX and Rx are up and running. Gotta get some more tubes. Am becoming very fond of 01As. Tuff little beggars! Tired of switching them from one rig to another.

Greetings. Just got back from a weeks long vacation to toasty warm Puerto Rico were it was 82F every day, and below zero at home :) The other day there was a 96 degree difference between Puerto Rico and home, yikes.

Here is the latest email and snail mail log list for the BK 29. Check for your call sign to make sure I got ur log. If you haven't sent in your log, please do so. In a few weeks I will be sending in the list of W2ICE/0 contacts to Ed Gable. If you want a real W2ICE Bruce Kelley QSL card for your QSO with W2ICE/0, send an SASE with your QSL card to Ed Gable in c/o W2AN at AWA headquarters.

Several people have emailed saying the BK 29 contact info and log sheet template wasn't on theAWA webpage any longer. I looked and agree. Tim W1GIG checked into it and found that the web master pulled it down a bit early. He will put it back up for a few more weeks. Hope to see alot of the guys on this list on the Linc Cundall next weekend. 73, Scott WA9WFA

I have it all wired. I believe and I think the regen should work. It has been my experieince the hartley regens on battery power will cover a fairly broad range just by keeping B+ under osc point without an actually regen pot. Not likely the whole tuning range but perhaps a good portion of the chosen band. All hI need to scour the house for tubes which may be ok. I dont feel lucky today so will wait till another day to try the Rx out. It is a bit exciting the thought that it may actually work. Signal is very clean on battery power. Anyway till tomorrow.

I had it going early this morning. Had a squeal and some noise but no signals and it could be 80M was just dead but I dont have enough good batteries as these are last years for my studio A regen so its off to the Dollar store to reload. Probably buy 30 nine volts. I found enough tubes and have a couple more mods I wish to preform. I must say for me the idea of having a real 1925 ham station is exciting. I am going to remove heater controls from osc and PA tx tubes and let them run direct full 5 volts. Then use that rheo for the regen tube which will give me a gain control.without drilling and blasting the front panel. I am also going to wire in the key connection to the PA independent of the audio B+ supply and I need to spend some time on my lathe with a hardwood dowel making my adjustable modulator assembly. No 1 though is getting the regen proved and running for sure.

I got it! Was just listening to W1AW code practice and CHU time signal etc. Rechecked to make sure tx still works , It does. Tomorrow I will clean up the wiring. Install the Key line and figure out an external switch to kill the osc and fire the regen. Regen couples to the tx antenna nicely with gimmick cap. Since neither will be on at the same time I may not have to switch it. I see how much it bothers it if at all. Is it super duper wonderful? probably not by today's standards. . Is it usable and practical? Yup! regen is controlled by controlling heater voltage on the detector stage and it appears to work pretty good. A regen is after all just a vegetarian oscillator starving for power. Feels like 1925 Ham station.
It was for me a very interesting project. I tried a lot of things before I settled on its current set up. Volume is quite decent too. Output is 1000 ohms and all I had was a 2500 ohm single earpiece a friend found in the mud at the local dump. Still was decent and I didnt need full throttle on the output tube. No external changes so no one would know looking at it that it is a mopa and the three stage regen..

The TX output circuit may load down the antenna circuit of the regen making it less sensitive, and reduce the Q of the regen grid circuit (which would affect sensitivity and selectivity). You may or may not notice these problems, so if you don't go for it! If you had an extra '01A in the set you could probably wire it up as an untuned RF amp for the receiver. The amp stage wouldn't provide much, if any, gain, but it would isolate the regen grid tank from the output tank while still coupling the regen to the antenna, and also serve as an automatic TR switch by going into cutoff on transmit (if the grid resistor on the RF amp stage was chosen accordingly).

73,
-Larry/NE1S

Thanks Larry, Yes, it may or may not bother it much however with morning here I think since I am switching it anyway I may just include the antenna link in the switching. Normally I never listen on the same antenna except with my SSB stuff. I thought of several other options while building it. One being a power osc instead of a mopa however I was looking for a steady CW note so decided a lightly loaded or loosley coupled osc loafing along had the best chance and put the stomp in the PA. I have built regens with Rf amps but gave that up a few years ago for a bad job. A regen sure doesn't need the boost as it will sicken most superhet for sensitivity. and the isolation gained is quite localized. in most cases. But that is just me. A battery powered Tx is spooky because of the pure CW note. I won't have a lot of time on TX but as long as I get some that is fine.
If I was building another one this morning I would probably do a few things different as I was making it more difficult then it needed to be I discovered. Late last night after 80M had pretty well crapped out I had it going and was copying a SSB station nicely on the regen section. I turned on the computer and recorded a bit (10 seconds) I have no idea where the actual mic is on this computer so I just set the earpiece on the case and let it run. It came through although a direct feed would have sounded much better. Need to go to the wifi spot to send it. Tuning without gear reduction is always a challenge but it is a usable station and that was the goal. Nice having the three stages in the RX.

Oh yeah, I forgot to mention, I was able to use the original fancy clip in grid resistor (Daves Radios NJ, USA) and installed a 100 pf punkin seed underneath in parallel. I added an RF choke in the regen plate /audio transformer pri circuit. It may not be necessary but I like to use them to fence the RF in where it belongs.(and keep it out of the power supply and PS leads) I bought a bunch of generic ones from A1 Electronics in TO for $2 each and they seem to work well.

Well not everything goes perfect. Before putting it back in the case I trimmed up sme of my connections. When I finally got the harness done and fired it no osc in the TX. And I had tried everything on it before putting it back in the case but had done the pretty work after the tests. There are only so many parts in a H osc so I tested what I could from above. this morning I grudgingly unboxed it. First thing I checked was the grid leak cap. Surnuf. I had trimmed the wrong wire. Failing eyesight and low light mixed with befuddlement is a recipe for trouble I guess. I long for my youth when I was fit, could see and knew "everything!"

Date: 2015-01-14 21:08:52 UTC
From: Ron Barlow
Topic: 10726 Message: 10726

Hello all,
  Can anyone possibly help me with freq range info and possibly a source for a schematic diagram, for a Browning Labs model S-4 freq meter?
  A Google search yielded nil, except for an ad for an older (S-2) model, and the ad did not provide freq range info, for that model.

Crunch time now. I am not driving the mopas PA hard enough. I.8 watts is all it draws. 8 mils at 225 volts key down. I think it is because I am not pushing it hard enough with the osc. I will try adding some pfs in the osc plate to grid circuit and see what happens. CW note is not bad. I was listenng on my TS830S. No squawck and just the tiniest hint of a chirp which may be only right here. Of course as I load the osc to push the PA more that may all go out the window.
Also I found a complete set of tubes in my shack for this chassis. All 01As (should be one 171A but tis what it is.)So in the intrest of keeping my other pre 29 rigs running I pulled a 45 from one of my set aside projects and tried it in my bk stuff. The TNT is was a 45 so it is already so equipped. The hartley loved it. However the TGTP was not real happy on a 45 so I will score another 01A for it. Probably I will buy a 171A for the audio second stage of the new station and pop the OIA back in the TGTP. I must say though at around 300 volts an 01A give up little if anything to a 45 in output. (I measured roughly when trying the new tube)They are a very underrated robust lil tube. Somewhere you gotta know someone has one at 1000 volts in a ventilated base with a blower and a chimney(although leather bellows would be period correct.)

I have it working. I don't have my digital ma meter up here but over 20 mils at just above 220 volts key down (PA only) On a good nite should be enuf. Will be hard to find though. No chirp, no hum and no squawk. OSC can just be heard in a nearby rx but barely and it jumps to life when PA is keyed. A old style knife switch
DPDT handles transmit receive control. Killing osc power on receive and regen power on transmit. I elected a separate rx antenna. How it will perform I don't know. Time will tell.

I'm smiling. Receiver works quite well. Works nicely in the 80M band. Will need some more control to venture beyond but why bother it covers 80m well with little trimming required. Was just listening to W1AW and picked up my grundig traveler just to see. Not much difference in my rx signal then its. Checked out the time signal. Tried some AMers no trouble reading the mail. Also SSB is ok . So It is a workable receiver good for decent signals. Also picks up the hum on this room which has always been bad. However some quick testing indicates a ground to earth may take it away. (Disappears if i put my hand on the metal face.) No sensitivity to hands which is nice. Tuning is sharp but with no reduction drive very quick so touchy. Some signals coul be copied with the Audio Pa off but thing really wake up when you pull that switch out. I am currently using a pair of Brandes 2000ohm even though output is clearly marked for a 1000 speaker. I have one in studio B but it has a phone jack plug so I will have to fab an adapter as I need it for other old radios. I am running 30 nine volt batteries. One is used for bias (C battery) 29 for power. But 7 for regen only and an additional 7 used to power the rest of the audio section. This is above the 90 volts speced but won't hurt anything and some of the batteries are used having spent a ear running my twinplex although still decent do have some sag. On keying an additional 13 are added to power the PA in the transmitter. I should get a box maker at the craft store and some of Lous burgess battery stripes and make a correct looking set of batteries. I can run the heaters about a hour or just under on a 6 volt gel cell stolen from a rechargable flashlight. (along with its recharger set up.) They are often on sale for $5 and I buy them and take the battery and charge circuit out of them. I am getting used to running it right now but hope to get QSO soon.

Hi Lou,

Try this link: http://www.kwarc.org/dbaccess/radio1923.html

You can search Hams in Canada by callsign, or city, etc. etc.---but the only drawback is that it refers to 1923 ONLY...

Interesting, just the same, though, IMHO...!

When I was a pre driving teenager I bought a No 11 Wireless Set from radio centre in Chomedy. $4.99. It was made by Canadian Marconi Co. I bought a second one (made by PYE) and another for parts that had all the tubes. I had the dynoms and all. At first it dont work but mydad , an instructor at N01 Wireless School during WWII told my he wouldn't fix it (it was an Army radio, he was RCAF) BUT if it was a N01 19 set he would inspect and clean the multi thru switch with carbo tet , bend all the contacts slightly and retry. BINGO! Worked like a charm. Had it for several years. Here is a pic above of the unit without its dynoms Man how I wish I had it now!. There is one in the Communications Museum in kingston but I doubt I could pry it loose. Freq range? 80m and 40m.

That is tempting although the 19 is a pretty flimsy piece compared to a 11. I found an 11 for sale in Italy after you wet my appetite. It is missing a lot and the price was insane so I am holding my breath till the temptation for either passes. I have a complete ARC5 command station running (BC 454, T18 plus an operational 160 M TX as well) so perhaps i should be happy with that even though tis under the wrong flag for my VE call.

1911, according to this cartoon.
I do not think the cartoon is accurate, though, since it shows crystal control for 1925.
Everybody knows that amateurs didn't use crystal control until 1930.

Hello Ed,
Thanks for the posting about the available Wireless Set No.19. It needs it's cabling and such but looks otherwise pretty much complete, and it looks like it comes with a spare set if any parts are needed.

Sometime ago I came across a complete Wireless Set No. 19 MK. III made by Northern Electric in Canada dated 1944. It's complete down to it's dogbone cable and other cabling including the headset and carbon microphone combination and even the hard to find variometer. I had to go for it. It looks like its almost in new condition!

I checked it out as best as possible and applied power to it and unfortunately didn't get anything out of it. I still have it on my agenda to get operational and working in proper order. From what I understand they'll do 3 watts of grid modulated AM, and maybe 7-10W on CW.

If anyone reading this has any tips on how to get a Wireless Set No. 19 operational, or is currently rerstoring one I'd like to hear from you so we could compare notes. I can be reached at n3ibx@....

Thanks for reading this and hope to hear from one with some experience with one, or someone who is currently restoring one.

Mod-U-later,
Joe Cro N3IBX

Nice find...

Crystal control, although not in widespread use until the early to mid-1930s, was certainly used and understood well before 1930 and the 1924 date is reasonable. Here’s the evidence:

Clayton, John M., 1DQ, "Crystal Control for Amateur Transmitters," QST, Nov. 1925
Shaw, H.S., "Oscillating Crystals," QST, Jul., 1924

1911, according to this cartoon.

I do not think the cartoon is accurate, though, since it shows crystal control for 1925. Everybody knows that amateurs didn't use crystal control until 1930.

Crystal were indeed in use as early as 1925 by hams, although not by many. It is described in the 1926 first edition of the ARRL handbook, with circuits, and in even earlier QSTs.

Regarding rotary gaps use in a ham station, I would agree with the 1911, however, I do not believe too many hams used them then. I should and look through some of my early wireless catalogs from the teens and see when they first appeared for sale Of course a lot of hams just made their own.. 73 – Mike

Although the piezoelectric effect was known well before Pierce's work, I believe these papers set the stage for modern crystal control of transmitters:

Cady, W.G, The Piezoelectric Resonator," Proc. IRE, 1922., Vol. 10, p. 83,

Pierce, George W., "Piezoelectric Crystal Resonators and Crystal Oscillators Applied to the Precision Calibration of Wavemeters," Proceedings of the American Academy of Arts and Sciences 59 (4), Oct., 1923: pp. 81–106.

I have had it up and running now for a few days. Been calling CQ on or about 3555 + or-. Had a ham listen for me last night but he doesn't do CW so he wasn.t sure if it was me or not.Said it was a bit chirpy. so it probably was as I leave the osc running and key the PA. Anyway I have been unable to raise anyone even with my hartley in studio B so it isnt a great week for low power rigs. In fact sometimes I can't even hear CHU here. Activity I have heard has been very light. Usually this section of the band is very busy. Sometime I will make a contact then I can move on to the next adventure. Tried this morning just now but 80M is QUIET! Need good conditions for sure and they just aren't there right now.

I have been playing around on 40M with the old three dialer. It works up there too. I even had it doing some AM with my new adjustable modulator. Using a sniffer bulb I can now set the adjustment to the point where the mic will work without over coupling. Then unclip bulb and clip in the mic. However this rig really doesn't have enuf suds to be practical for AM . I just wanted to see if it was upwards modulating which is the definitive proof for proper adjustment with this method and it is. Anyway it all works but I would like some more stomp to be honest. I am only getting about 1 to 1.8 watts out depending on freq and I am not happy with that.

I have been working on the PA a bit and got it up to a decent level. Modulation is quite good as well. Currently tuned up on 3580 kcs and give it a shot when I am in this shack. It has enough it should be heard in favorable conditions. I have to remove it from the case once more for a small mod in one circuit but it has found a permanent spot on the desk behind my computer. Wish I had another one to do. I would do things a bit different and perhaps a #10tube in Tx PA. Still this one is a joy to play with. CW is good. You won't know its me (no HMMMMMMMMM) There goes my best worst title! Fun Project!

Hunched over the controls of the old radio, An old Signal Electrics MFg Co key in my fist and listening to the faint cw signal in between on a pair of original Brandes head phones in the dim light of a dull lamp I spent the evening living the dream. The converted radio works pretty good. I got a guest op today for about 20 minutes and had him send while I drove around with a portable to check field strength. Not bad. Similar to the Bare Essentials rig but not quite. There is a spot on the road I check them at. So far anything I can hear strong there gets out in good conditions. Band in this area has not been too hot the last few days however I give it a shot when I can and love throwing the old knife switch which switches the OSC off and the regen on. Listening to the slight microphonics of the regen tube as it bounces slightly in its spring suspended mounting as I bump the desk accidentally. Tis a lot of fun. Here in Studio A it is 1925 all over again. All I need now is a set of wire rimmed glasses. I just love this kinda stuff! Picture quality in this case captures the moment better then modern would. Period correct so to speak.

Hi Guys,

This site might appeal more to the Canadian likes of Lou, or Don, in their efforts (maybe) to locate Hams who might be living near by to them:
http://apc-cap.ic.gc.ca/pls/apc_anon/query_amat_cs$.startup

It's an Industry Canada site that allows one to look for Hams in a specific city (by province), or by last name, or by actual call sign. I did a search of Amateurs here in my home town of Newcastle, & was surprised at how many Hams reside here...!

How come they're never on the air, though...?!

Hi Don,

What they don't know, they don't miss...

I grew up in an atmosphere where a lot of Ham radio peripherals / equipment were homebrewed---it was just "...the way it was," I guess.

But you know what...? I get more fun outta building & trouble-shooting my creations, than I get actually using them...!

Go figure.

I hear you, Don. My only "appliance" is a TS-440S I bought new in about 1986 or so. With rare exception the only thing it gets used for is tuning the antenna, and as source of a stable carrier to excite the big homebrew PDM AM rig. If I was into contesting or chasing DX it would get used more, but I'm not. On those occaisions when I get on SSB it's so much more fun to use the Central Electronics 20A (1953 phasing-type SSB exciter) which I've re-engineered into a 100W rig. (It's as much NE1S as it is Central Electronics at this point, much like all the other vintage commercially-manufactured ham gear at this QTH).

I unplugged the Brandes earphones and reinstalled a set of pins on an old UTAH speaker I had gotten from my brother many years ago. He said it was out of a very old cabinet battery radio that predated the powered coil speaker sets. It always worked but isn't pretty having been designed to be hidden not displayed however it does work and always have. It appears to match this set well as I just plugged it in. Band is dead at the moment but what was there was heard. In Similar fashion to how I would hear it on the old phones. Probably because it matches the output impedance of this radio perfectly. 1000 ohms. I will see how it sounds tonight but leaning or hunching over the radio because of a short phone cord is apparently not good for one recovering from a fractured back. (So the XYL has informed me) I have another fancy speaker. A big reversed cone one. It doesn't work but I suppose anything that can be made can be fixed. Has an open winding or a faulty connection of some kind.

Wow, that's weird. The reply I had added below Don's post didn't come through on that last post of mine, although they were there in my copy of the message in my "Sent" folder. Here they are again:

I hear you, Don. My only "appliance" is a TS-440S I bought new in about 1986 or so. With rare exception the only thing it gets used for is tuning the antenna, and as source of a stable carrier to excite the big homebrew PDM AM rig. If I was into contesting or chasing DX it would get used more, but I'm not. On those occaisions when I get on SSB it's so much more fun to use the Central Electronics 20A (1953 phasing-type SSB exciter) which I've re-engineered into a 100W rig. (It's as much NE1S as it is Central Electronics at this point, much like all the other vintage commercially-manufactured ham gear at this QTH).

73,
-Larry/NE1S

I did install a Collins mechanical filter in my TS830S back then. My brother had a bunch NOS and I asked my Dad a former design engineer for Collins if it would work since it looked like it would fit. It was on the wrong side of the pass but he said with the adjustable notch I would probably still be able to wiggle over and use it. And he was right. Not perfect but usable. I have seen some Central El stuff. Neat looking. I guess I have my ARC5s and my DX60B although I look forward to the day when I can send it down the road. (The ARC5s are never leaving!) I love using stuff hand built when possible or severely modified as this Three dialer deal.Currently I am really enjoying it!

10785. Fwd: Bolinas Antenna Damage - MRHS Newsletter No. 50

Yahoo group: AWAGroup (2014 — 2016)
Date: 2015-01-26 18:32:15 UTC
From: Bill Stewart
Topic: 10785 Message: 10785

Good Afternoon all,
I am forwarding this MRHS Newsletter to the list in case some may be interested in reading about the antenna damage at KSM/K6KPH-Bolinas. As you may know this is a mostly volunteer/donation supported on-going project. If you can send along some monetary support to help in the antenna repairs, I'm sure it would be greatly appreciated. Also, note later in the Newsletter, that the MHRS has been granted use of 512khz. It is really a thrill to hear KSM transmitting again on their assigned coastal frequencies...some of which are down due to the antenna damage. Give 'em a listen and send in a report.

Thanks...73 de Bill K4JYS

> Bolinas Antennas Suffer Heavy Damage in December Storm

During a severe storm on 12 December the antennas at the transmitter site in Bolinas suffered heavy damage. As a result several KSM and K6KPH transmitters are off the air until further notice. This includes transmitter A7, the 500kc/426kc transmitter

Here's a report on the damage by Transmitter Supervisor Steve Hawes

(EDZ = Extended Double Zepp antenna)

On Saturday morning, Bob V and I inspected the situation. Yes, the MF antenna was down.

Downed pole that held one end of the Marconi T MF antenna

From the paved road to Bldg 1, and standing in front of Bldg 42 (the tuning shack) we could see that the ant line was still attached to the West pole and ran through the brush, across the road and continued to the east. The line was no longer attached to the feed point of the pole by bldg 42 The line is about 3 feet off the road surface where it crosses and had been marked with yellow safety tape. We returned to the building and proceeded to bring up all transmitters.

Problems were noticed as follows:

Tx A1 3550kc Very high reflected power.

Tx B3 8438.3 High reflected power

PW-15 12B 12993 high reflected power

Tx D4 21050 had high reflected power

A couple other transmitters had marginally high reflected power.

Around 1300 we went into the South antenna field to check the situation. We did not observe any twisted transmission lines, but saw the following:

The 4216 EDZ antenna, used on Tx A1 (3550) was down and draped over several feed lines in the South antenna trunk.

The antenna feed point was tangled up in the H-frame and there were broken wires.

We proceeded to cut the 4216 antenna line in several places (immediately adjacent to the insulators) so the wires could be pulled off the feedlines. Then I observed that the common support pole for the 4216 antenna and the MF antenna (this the the farthest West pole in the first row) was ON THE GROUND. The 4Mc and the 500kc antennas appeared to still be connected to the pole. We had to cut the steel support cable for the MF antenna so we could clear another set of feed lines. We did not have time to examine the pole.

The pole fell approximately to the North. Parts of the 4216 and are still up in the h-frame. Following the above work, all of the still operating transmitters had nominal reflected power. There are now 3 antennas down and out of service: The MF antenna is still connected to the feed wire, but most of the antenna is on the ground. We did not have time to pull it up off the road.

The feed wire is hooked over one of the climbing steps on the feed pole by the tuning house and it would probably be easy to pull enough of the ant wire down the pole and tie it off, to get the west ant section to clear the road.

The MF antenna appears (I think) to be intact, except for the support at the top of the feed pole (broken insulator?) and the steel support cable at the east end that we had to cut to clear feedlines. (Possible quick fixes-Re hang the West section from the tuning house pole to the West pole and have a temporary "Inverted-L", or find another pole in the general direction of the east pole to support the east end of the MF antenna. (until the fallen pole can be replaced or hell freezes over, whichever occurs first.)

The 4216 ant is down and in pieces. The 8247 EDZ had been down for some weeks. KSM is off the air on 426/500 CW and 8433 NBDP. K6KPH is off the air on 3550.

As you can see, we face a daunting task. And this does not include the antenna maintenance required at the receive site where, thankfully, the antennas survived the storm. Can you help with this giant task? Lots of True Believers have already contributed to the antenna repair and restoration fund, and for this we offer sincere thanks - but clearly we now have more work before us than ever before. If you can help just click on the button below to make a quick and easy donation.

Make a Donation

Thanks!

> MRHS Granted 512Kc!

We suppose there's some irony here with the Marconi T antenna on the ground, but the Federal Communications Commission has granted KSM, authorization to use 512kc.

Old timers and those familiar with maritime Morse communications will recognize 512kc as the frequency to be used when 500kc is occupied with distress communications. Part 80 of the FCC rules permits this frequency to be assigned to coast stations in the maritime mobile service.

The MRHS applied for this frequency as a sort of lifeboat channel.

We consider 500kc to be the most historic frequency in the radio spectrum - a sacred spot on the dial. 500kc was the center of marine communications for decades. Coast stations constructed elaborate antennas for 500kc. They used tens of kilowatts of power, their signals spanning the oceans on cold winter nights. Hundreds of well trained ears, ashore and afloat, monitored 500kc twenty-four hours a day. The mundane routine of maritime commerce was heard on 500kc - until those most electrifying three letters in radio, SOS, rose up out of the static, a plea for help from a mariner in distress upon the sea. Then all normal operation ceased as operators pressed the earphones close to gather in every word from the distressed vessel.

KSM still stands watch on 500kc. Our operators scrupulously observe the silent period twice an hour. It's a tradition going back to the early days of radio history. But there are forces at work that may eventually threaten 500kc. There's talk of an augmented NAVTEX system planned for the frequency. Others may have other ideas.

We plan to continue operation on 500kc as KSM and KPH always have. But if the day should ever come when the sacred frequency, and the memories of the men and women who used it in their hour of need, is sullied by the presence of another service, well, at least KSM will have a place to go to carry on the tradition and keep the faith with those who came before us.

We have to activate 512kc within 12 months of the grant. Even now the MRHS Transmitter and Maintenance departments are poring over blueprints and exercising their slide-rules to determine the best way to do this. It's not a matter a spinning a dial and tuning up on the new frequency. Even though the new frequency is only 12kc away from 500kc, that's a big percentage move. We're dealing with a new, high stability exciter frequency and tuned circuits in multiple stages - plus the antenna tuning unit in the tuning house at the base of the Marconi-T antenna.

KSM's transmitter A7 may be used on 512kc

One possibility is to use existing 5kW transmitter A7, a Henry MF5000D. Or we may restore another MF transmitter specifically for 512kc. We have two Harris 5kW MF transmitters from KFS, one of which is even now being restored to service. being restored. Either way, when we are ready to begin testing on the new frequency we'll let you know so you can monitor and provide us with signal reports.

> Frank Geisel's Report No. 2 - March 1946

In Newsletter No. 49 we presented Frank Geisel's KPH report for January 1946, soon after the station resumed operation after the war. This turned out to be a hit among True Believers who asked that we continue the feature. So... let's take a look at what FG had to say in his February, March and April 1946 reports.

In his report dated March 2, 1946 (for February) FG mentioned composite transmitters 78 & 79. We have the control panel for one of these, donated by Denice Stoops after it adorned her bedroom wall for decades! FG also archly complains that the Matson liner Monterey , a RCMA ship, has been giving her traffic to competitor KFS!

During March FG reported that the KPH 126kc transmitter B11 (apparently different from BL11) was returned to service (the 126kc authorization is still part of the KPH license) for paid press and traffic lists. Both the Western Union teletype circuit and the transmitter control cable failed. RCMA ships Mariposa and the "presumably reformed" Monterey continue to use KFS. FG took a week of sick leave.

In April FG reported that ex-KHK 2kW transmitter was placed in service but it proved problematic. Ships "in the Orient" reported interference to the KPH 8420kc signal from an unknown teleprinter transmitter and parasitics from NPO. Matson liners Mariposa and Monterey , RCMA controlled ships, continue to use station KFS of arch rival MacKay Radio, costing "hundreds of dollars" in lost revenue. Western Union is routing KPH messages to KSE (RCMA station in Southern California) which then must relay them to KPH. KPH had lots of traffic for government MST ships but they were not contacting KPH to get it. FG asked KFS operators (!) to tell these ships that KPH was holding traffic for them but "cooperation in

this respect depends on the operator on watch". We'll bet!

> Mini Night of Nights Report

As announced in Newsletter No. 49 , at the end of October 2014 the MRHS participated in a MF-oriented "Mini Night-of-Nights" event in cooperation with Dr. Fritz Raab. Here's a report on the evening from Roy Henrichs of the MRHS Operations Department:

I can provide details of our MF activities for that day, as I was the commercial operator on watch. Activities are documented in KSM logs, which are maintained at the station - I do not have those here at home, but do have my notes from the evening.

KSM followed our standard published operating schedule until normal station close (0100Z). From that time until final close (I do not have actual time here), we provided continuous press and NOAA weather broadcasts throughout the evening. These were announced on 500 kc (CQ) immediately before beginning of each broadcast, with PX/WX broadcasts taking place on 426 kc.

KSM maintains a continuous efficient watch on 500 kc at all times of operation. However, no experimental station transmissions were heard on 500 at any point during the evening. We did, however, delay one of our 500 kc CQ's due to likely infringement of ISP. QRX notice (wait) was sent on 426 at conclusion of the prior PX/WX broadcast, with reference to ISP, for benefit of our listeners.
We at MRHS regard 500 kc with a geat deal of reverence, in respect of its historic use - and are pleased to report that experimental stations appear to have treated that frequency with the respect that we believe it deserves. We continue to encourage use of 500 kc in its historic context as a distress and calling frequency, including observation of the historic international silent period (ISP) - and trust that experimental stations will continue to follow our lead in that matter.

With 500 kc apparently silent, I spent much of the evening tuning the band for experimental stations. 500 kc warch continued during this period (dual receivers used).

At approximately 0303Z, I heard WG2XSV (Vancouver, WA) on approximately 474 kc, QSA2 QRK3. I also heard WD2XSH/20 at the same time on the same frequency, QSA5 QRK5. Sent email to both ops, and received responses from them at our radiomarine.org address.

I also took the initiative to provide reception reports for these stations on 500 kc CW at the beginning of one of our PX/WX broadcast CQ's, with statement that we would follow up by email. This in recognition of the experimental MF station effort and our participation in same by listening for these stations.

Our listening efforts were somewhat limited by our own 5KW signal (from less than 20 miles away) hitting our receivers hard. Also, I heard what appeared to be weak birdies at various points in the MF band. Whether these actually were loe power experimental stations engaging in digital communicatons is unknown. Or, perhaps real birdies from local BC stations hitting our receivers - as we do not routinely listen to frequencies other than 500 and 425 kc.

I do recall an email comment from one of the stations I heard mentioning that he had not been listening closely for our broadcasts - probably was more focused on hearing/working other experimental stations. No problem, fully understood: makes sense! Please do not regard this as a complaint - I am just reporting a comment from one of the stations we heard.

I can tell you with 100% certainty that our operators really enjoyed working this special event. It was a very unique, extremely pleasant, and festive evening at KSM/K6KPH! And, we were pleased to work with your group to the extent that we could. Almost certainly would do this in future, if feasible.

> Get Your Radiotelegraph License Endorsed at KSM

As always, we offer holders of commercial radiotelegraph licenses the opportunity to sit the circuit at KSM and have their licenses endorsed as commercial operators. As holders of these licenses will be painfully aware, there is no longer a space on the back for a service endorsement. However the MRHS management has at great expense invested in an official MRHS endorsement stamp which will be applied to the rear of the license, the information filled in with a genuine mill typewriter and signed by the KSM Chief Operator. With this you will be suitable for employment at any US commercial Morse code coast station.

What's that? You say you don't have a commercial radiotelegraph license? Well, the MRHS is ready to help you out in that department as well. Check out the article below.

> Radiotelegraph License Exams Available Through MRHS
First exam scheduled for 7 February

Here's the information from Roy B. Henrichs:

In Newsletter No. 49 , I reported that MRHS would soon begin administering FCC Radiotelegraph operators license examinations, as we had entered into an agreement with the W5YI Group to do so - and, at the time of publication, were awaiting receipt of credentials and license examination materials from the W5YI Commercial License Examination Manager (COLEM).

I am pleased to report that all required materials and credentials now are on hand - and that we now can schedule the first examination session. Since the holiday season is in full swing, and because examinees will need reasonable time to prepare for the exam, we have scheduled our first examination session for 10:00 AM, Saturday, February 7th, 2015, at the Point Reyes Fire Station, 4th and B Streets, Point Reyes Station, CA.

True Believers who intend to take the exam on that date should contact Roy Henrichs via email: wb6ovv@arrl.net in advance, so that we can prepare for your arrival. While advance notification is preferred, we can handle you on relatively short notice - but do need to know your plans because we will need to print your examination before the day of the exam.

If, for some reason, that date does not work for you - please be advised that we plan to offer examination sessions on roughly a quarterly basis. And, possibly more often if there is sufficient demand.

Newsletter No. 49 outlines the examination process and provides basic information concerning the exam. Please note that examination fees for the elements you plan to take must be paid at the time of the examination, by money order or certified check payable to the Maritime Radio Historical Society - or in cash. Please do not send fees in advance; that keeps things simple for all of us, should last minute circumstances prevent you from attending.

The original plan still holds: pass your examination in the morning, and get a Proof of Passing Certificate (PPC). You immediately get full bragging rights for passing this

penultimate examination - and, then can come out to the station, tour the facilities, and sit the commercial circuit for the first time that afternoon! File your PPC with the FCC on the specified form (which we will provide), and get your permanent license from the FCC by mail.

It simply doesn't get any better than that.

So, the next step is up to you. Let me know if you have any questions . . . and, we look forward to having you on board soon!

73,
Roy Henrichs

> Radiotelegraph License Exams in the Portland Area

OM Bass wrote with this information for those in the Pacific Northwest:

I am an FCC examiner (with National Radio Examiners) and I administer the FCC exams. If any of your members live in the Portland, Oregon Area I can administer the FCC examinations.

I live just six miles south of Portland in Milwaukie, OR. My phone number is 503-860-3777.

I do the exams on a request basis. Individuals can call and set up an appointment anytime during the week day.

The Radiotelegraph Operator License is a lifetime license and requires written exam of FCC elements 1 and 6, and telegraphy elements 1 and 2. Telegraphy exam element 1 consists of copying code at 16 words per minute (Five letter/number code groups) and element 2 consists of 20 words per minute, Plain language.

The cost is $125.00 for FCC Elements 1 and 6 and Code elements 1 and 2.

It should be noted that the radio telegraph license is not usable for repairing or servicing the new GMDSS (Global Maritime Distress and Safety system) radio equipment. It requires a FCC GMDSS Maintainer License. Operating the radios requires a GMDSS Radio Operators license.

Added information.

I was a Radio officer serving on Military Sea Transportation Service in the early 50's and served using CW. I do recall working a Russian station in the sea just off Alaska. As a young and "smart" radio officer I had the speed key out and decided to pass some traffic his way. He returned my "call up" so fast it sounded like a single tone. I sent a QRS (send slower) and put away the speed key for the rest of the voyage. Some people never learn!!!

In the early 90"s I was working as a Electronics/Radio officer for the Military Sealift Command (the new MSTS) and most traffic was sent via satelite. That was the day that the equipment malfunctioned and we needed to pass traffic to the Navy department re the equipment failure. So as we were in the Med a call to Radio Casablanca was in order via CW. BUT there was no hand key for the equipment. The Engineering department of the ship built a key from a few screws and part of a hack saw blade. The message was sent and I still have the "Key." You never know when CW will be needed.

Maybe more later as this old mind recalls some of the unusual conditions on board the "Code" ships!

> Matson Navigation Company Needs REOs!

Yes, we hear it all the time: "What good is the radiotelegraph license? Nobody's hiring radio officers anymore!" Ah, but that's where you are wrong my friend. Radio Electronic Officers are in demand at Matson Navigation Company - and possession of a commercial radiotelegraph license is one of the requirements! Copy this from the current REO aboard Manulani:

MANULANI REO

Jan 11, 2015

We are currently short of R/O's due to picking up Jobs on the Watson Class MSC ships.

The Matson ships require the R/O endorsement On your USCG papers, along with several computer certifications Network+ A+ and Security+ or their Microsoft equivalent, evidence of Electronics training and Radar endorsement/experience are also required.

The Watson Class ships also require a Windows Server Admin cert and security clearance. The best part is 26 days paid vacation for 30 worked. If you have any interest or know anyone who might contact our Secretary treasurer Mr. Cliff Walker. It's mostly a computer/electronic tech job today, with about an hour a day for GMDSS tests.

V. Cliff Walker

American Radio Association
Secretary - Treasurer
1600 Rabke Rd.
Canton, GA 30114
walker@araunion.org
770.592.3232 Office
678.522.7363 Cell

If you apply please keep us informed on your progress! And if you can figure out where to connect a key to the GMDSS console you can use KSM to send your traffic!

> Job Opening at the MRHS

We need to be clear about this - we're all still volunteers when it comes to the restoration, maintenance and operation of KSM and all the other MRHS projects you have been reading about. However the Point Reyes National Seashore has initiated a multi-year project to conduct a complete inventory of all the equipment and artifacts at both the transmit and receive sites - a titanic job as you can imagine. They have actually provided a budget for this project and part of that budget is earmarked to pay personnel.

Job title: Collections Inventory Assistant
Location: KPH/KSM receive site, Point Reyes, CA
Hours: 20-30 hours a week, M-F
Pay: $10/hour

Interested? Great! You'll get to hang out at a beautiful location, work with great folks conducting an inventory of classic radio equipment - and get paid! Just click HERE for full information and the job description.

> MRHS Merchandise

Support the MRHS and look cool at the same time. Such a deal! We've got hats, mugs, T shirts, belt buckles and bumper stickers, all with variations of the MRHS logo. Get a hat and mug for yourself and a put yourself in solid with the XYL by getting her a MRHS hoodie.

Plus you'll want to be looking sharp when you visit us on Night of Nights. No better way to do that than to be rocking some MRHS swag.

Click on the images to go to the True Believers Store

Just click on the images above to go to the MRHS True Believers store and browse our offerings. Thanks!

We hope to meet you on the air or in person at KSM. Until then we wish you the best of luck and fair winds & following seas.

73,

MRHS

Don,
There is some experimental activity on the LF freqs. I think Steve, VE7SL is involved with some of it. Also, the KSM 512kc activity has not started yet, but hopefully they can get it going soon. I think I read that they have a xmtr, but may have to do some antenna work I expect the recent antenna damage may slow things down a bit. The FCC grant for 512kc is good for a year.When all systems are working, KSM/KPH runs broadcasts, tfc lists, press, etc, just as they did before maritime cw was shut down. They also guard 500kc. They also activate K6KPH on several ham bands. They usually come up on their assigned maritime freqs on Saturdays for several hours. Check the web site for freqs and times. Also, the MRHS web site is very interesting.

Thanks Bill, Yes I have been following VE7SLs exploits whenever it comes to mind. Coasts on PBS did a thing on VLF this weekend. As it relates to Sub communication. I need to build a VLF regen using a 455 kc IF coil perhaps. Should be some ancient tube too (27 perhaps or a 19) just to make it right. On my bucket list is a visit to SAQ should my spine fracture ever heal enough to travel again. Even an old three dialer TRF could crawl down there I think but one would need to make the detector regenerative for the BFO style function to properly copy CW.

I am sitting here now listening to the lads on 3705 on my three dialer with the speaker. It really doesn't work that good on the set for shortwave but these lads are strong enough I can still hear them so it is back to the earphones after tonight and I just enjoy the moment for what it is. Someday I hope i find another one of these in not restorable condition a I would like to do it again but in a more serious vein. Next time I think I would just leave the cap and coil forms and tube sockets in place and clean the rest out and build from scratch more or less. The audio circuits though are ok as is.

Perhaps for the VLF regen a TV peaking coil rather than a 455 kc IF can would be in order?

Dan, I am not familiar with them. Could you elaborate and explain the advantage over an IF coil? I have a regen built sort of. A pair of 6v6s. I could rededicate it to VLF with a little effort I think. I hadn't thought of it before but it is all there including power supply. just would need a new tank coil and a bit of rubbing to get it working on VLF.

Hi Don:
When you speak of "VLF" I assume you are referring to the spectrum below 30 kilohertz? If that is the case a 455 kilohertz IF coil would not have anywhere near the inductance necessary to resonate at VLF. It would require a tuning capacitor in the *microfarad *range rather than the *picofarad* range of tuning capacitors. The inductor I am referring to is called a "peaking coil" which were used in older (CRTstyle) TV sets for the horizontal oscillator. Most were ~20 to 45 millihenries in value. I have included a photo of what one looks like. You might verify to me the tuning range you desire.

If the attachments to this email make it through, they should give some idea of the types of coils and capacitors necessary to tune LF and VLF frequencies. Otherwise, refer to the article in Electronics World for Sep. 1961.

Thanks Dan, I guess I mispoke myself. My area of interest is probably 150 to 500 Kc approx. I guess I thought that since adding regen to a 455 Kc IF is often done That already had instructions available and getting the coil down to 150 should not be a huge problem with a bid of C padding. Also some IFs are Perm tuned which is an area I have explored quite a bit in regen building (Slugabsorb Regen design Solid state regen) and it changes the whole ball game often. All of the sudden a somewhat unruly radio settles down to a wonderful easy to run piece. I don't know what amount of activity there is on LF as guess I should call it. Still it is an area that has had me curious for years so I would like to explore it a bit. don

For a good receiver in the LF range consider a BC453 command set. It covers 190 to 550 kHz as I recall, has one RF and two IF stages, and good calibration and a slow tuning rate.

Here is what happened here. I started tuning up about 7.24 according to my computer clock. I made sure everything was good and sent a couple of calls then realized I was a bit early. I am on batteries so I dont want to burn out. At 7.30 I started. part way into my calling I could tell in the monitor the PA had quit keying. I have had that happen twice before and once I had a volt meter here and discovered my Pa 225 volts had vanshed then in a couple of minutes it returned and was OK. this time I wiggled everything including tuning to try and get it back going and in a minute (seemed like an hour here) it began keying again and it is possible I didn't get it back right on 3615. I did try twice at least to recheck the tune so you may have heard a sweep by a couple of times and it would be quick as I am direct tune with no gear reduction. Then I heard Dave and Lou answered him telling him he was looking for me. then some phone guys started up nearby and it became almost impossible to continue. Eventually it was over and so I clipped on my mic and tried to break into the phone deal . Not my day! Finally I switched it to receive. I now have the receiver working well enough on the speaker I am worried the sound will bother the XYL in the next room. later before bed I spent sometime playing with it and now I think I can operate it much better then I was even earlier. I had done some testing earlier in the afternoon with the XYL keying it and me at a bit of a distance with another Rx. It was really quite strong so I am disappointed not to have made it. The good news though is many of us were there , some on the air and we all had fun. That is not insignificant. I am going to work that 3615slot at that time till I am heard so if any are listening jump in or confirm.
As for my momentary loss of power I think and it is just a guess that when the batteries are warming up one of them opens up at a certain temp and then is later in a minute or so ok. Which one? DON'T KNOW. There are 30 nine volts clipped together for the PA B+and it only happens occasionally . So far three times

I was listening last night. Don, I was going to record you so you could see what it sounds like at a distance. I heard Lou calling and heard some weaker, rapid swishing like someone with an old time rig trying to get it to land on frequency. Then heard some dashes or short key downs but no calling. After all this Dave called Lou and I heard their QSO before switching off here. Don't know if the swishing was Don but if it was, it was plenty loud enough. Oh by the way the swishing and dashes I heard did have a bit of chirp. It was weaker than Dave and higher in frequency than where he was when he called Lou (on the other hand he was drifting down during the QSO) so I tend to think it was another station that I heard.

73,
Paul

Thanks Paul.
I have a chirp at key down. It is noticeable. I recorded it on a receiver some distance away yesterday when testing with the XYL pressing the key. I sent it to you in case it sounded familiar. My big concern at the moment is is it getting out. Everything I have checked that I can says yes however till I am sure (verified)I am not content. What I will do after that I don't yet know. The Rx is working certainly to a practical level. I would like to know the TX is as well. I have a 171A coming but my experience has been so far that a 01A at good voltage can give even a 45 some competition so I don't expect a huge gain as it already handles the same voltage. I have though even since last night learned to operate it better so it makes the most of what it has.

Something is wrong. I finished rechecking and finding the tubes for the Lf regen. Plugged it in , found the cans and heard ZZF with a quick tune which is ????????? Some CW station of some kind. Kinda frightening when it works without coaching. I must have done something wrong! Need to quiet down the PS but it is usable.
I used a 445 kc IF can surgicaly removing the lower coil(side cutters) and using some of its wire to wind 30 turns around the form just above the top coil for a tickler. I left the compression trimmers as is, used the old wires as well. Somehow I got the phasing right the first time. Pure luck! Both tubes are beam pwr 6V6s and regen is screen controlled. The rest is from the junk box. the variable cap is one from a multigrid tube transmitter experiment and I had pulled out about 2/3its plates so I will order an original to get full range back. Anyway the dumb thing works!

ZZF sounds like a non-directional beacon Don, however ZZF is not on the beacon database. Does it have a long key-down after the ID? Are you sure it's not ZZR or ZFK? Those are both active beacons in Ontario on 317 and 335 khz respectively - still in the MF range though. More inductance will get you down below 300khz in the LF zone.

I don't know what prop is like on LF but there seems to be some activity this morning. I am going to try and improve the PS hum situation. BTW Steve I have been enjoying your site. Your 29MOPA design is not far off what I started doing here with the old three dialers MOPA save I didnt use a choke in the Grid circuit and no voltage dividers on the kathodes (just high side connection) In the end I wound up fudging the circuit a lot to get it to work in the confines of the preconstructed TRF but had I not placed that restriction on the project that is pretty close to what I had in mind. Should work nicely.

Hum chasing is a very interesting past time. Normally iwould do all the things , the bypassing extra cap etc but I had already done that with this one to a large extent and had really made little progress. Where does the Hum come from I thought. hmmmmmmmmmmmm? My assumption was it was picked up by the detector and was amplified along with the signal. Tisnt so, at least in this case. I know because after shielding the gridleak, rechecking all the heater bypasses. Rechecking the Ps and realizing I had lots of C there and a reasonable circuit and adding more made little if any difference I disconnected the cap that feeds the signal from the regen detect tube to the audio tube. NO DIFFERENCE! So all the hum or at least a huge portion of it is being made in the audio stage and the regen detector and gridleak has little to do with it. Maybe I was pushing the Audio tube too hard. Sort of like when you turn up the volume full on a guitar amp you can always find some hum. I started inserting resistors into the plate (headphone) circuit in series and each time I increased the value the hum was reduced and yet the signal was still there and not noticeably weaker but noticeably easier to copy. I wound up with quite a bit in the circuit 390K to be exact and the radio still worked nicely. I tried playing with the screen resistor doubling the value but could not detect any improvement or loss. That either means it doeesn't matter or I am so far out of wack I need to make a huge adjustment. This is kinda of an off the cuff sort of build so there is no schematic to refer to exactly. I just used values I normally do with 7AC pinout Beam power tubes. I haven't got it perfect yet but it is a lot better , probably 200% better than it was. It was cool in the basement shack as we have sun and the solar devices were heating so no furnace running all morning and the basement cools down in this -4F weather after awhile. So I quit for the day although I did try changing values on cathode bypass cap to see if it affected hum. (nope) The Amp does not have a volume control and that would probably be wise. Also I calibrated the rig. Using the If cans original one winding and its built in ceramc compression trimmer I set top freq at 480kcs (covers all of 630M) and the bottom just on a fluke wound up at almost exactly 300kcs (300.1kc) I am quite happy with that. How do I know? With regen control over advanced I have a nice osc and my DX390 receiver does LF so tracking it was easy. A bit more improvement in hum reduction and it would be fine. Not perfect but certainly usable as is. Also my regen pot was an old NOS pull on off and pot combined so I rigged the supply to the to the AF tube grid through that switch to give me the abilty to kill signals to the AF section while leaving the heaters hot. That way if I get far enough along to build a TX for 630M I have a Rec standby function already installed.
Thanks Steve for the website which inspired me to give this LF stuff a shot. It is a lot of fun. Meanwhile back at the ranch here in studio A from 6pm to 10.30 Pm top and half the hour I will be calling CQ 3564.5. on the old three dialers. Volume on the rec is now so high on the old Utah 1000ohm speaker that I woke the XYL up last night . Not good!(for her ;>)

Hi Don,
I likewise had hum problems, with my regen rx. I am using a 24A tube (a 1920s vintage tetrode), which is a double ended tube (grid cap on top). I added a grounded shield that shields the tube, the short grid lead, and the grid leak assembly. That eliminated nearly all of the hum.
An .01 disc ceramic cap, from the cathode to the anode(s) will help with the tuneable hum situation.

Gentlemen,
My latest project needs a vintage tank capacitor which I have been unable to find on eBay or the net. I would prefer the part specified, as follows:

National TMC-150, variable transmitting capacitor

In a pinch a Hammarlund MTC-150-B or -C or even the equivalent Cardwell. The plate voltage specified for the National is 3KV.

I have the following vintage variable capacitors for trade:

2 National Girder Frame, 15-350 uuF, SLW
1 National Girder Frame, 10-100 uuF, SLW
1 National DX, 500 uuF, SLF
1 National DX, 180 uuF, SLF
1 National DX, 150 uuF, SLF, double spaced
2 Freshman Masterpiece, 30-320 uuF, SLF

All are in good condition. For the National, I would be willing to part with several of the listed items. It should be in good condition with no arc-overs.

Thank you for your kind consideration.

no Supply here means I built it so I have AC filaments on a 12 v transformer (seriesed) and rectified and tripple filtered HV (transformerless but keyed wall plug.) I know it wont be perfect but it is still a bit noisy. I was just playing with it now and tapped the one 40uf cap (input side) noise level of hum dropped signifcantly. When it came back I tapped it with a screwdriver again with same result so I obviously have a bummer in the stack. Normally I run all my regen on battery except the AM transceiver . It has the Powerhouse circuit in receive and is on AC heaters but not objectionable. It does not carry its transformer but steals its power from one of my homebuilt bench supplies. I will order some new caps and rebuild the PS however when I tapped it it got good enough I could live with it. In fact if I could turn down the volume (had a volume control) it would probably be just fine. I am looking forward to exploring the LF band. Did some listening today and it is definatley not dead.

I have never seen my call on rb ever even when running POWER. however I did give it a half hour of pounding brass to see. The other light bulb moment I had however dim it may seem was when I realized I did not hear any of the stations Paul mentioned hear so it could be simply conditions. The only station i heard was a KB3 faintly. I was listening on my Kenwood TS830Sand in CW Wide mode SO I said if I can't hear them and I am sure they are running probably 50 to 100w stations which would be a reasonable assumption it would be impossible for them to hear me with this little rig under such conditions. I also realize how fortunate we all were in the BK as the band (80M) was hot. I may test my battery pack over the next couple of days replacing any bum 9 volters and wait impatiently for a night of strong activity. Anyone who is closer to me toomight hve a better chance.

I'll be operating using AWA's callsign W2AN from 6PM until at least 9PM
this Sat. evening where I can find a free spot between 1880 - 1900 KHz.
Drop in on AM and say hello.

I had a bad hum on this rx. It was annoying. I had tried all the tricks , bypassing grounding not grounding sheilding etc etc. I did get it down to usable but it was still too much to leave. This morning I clipped out the hv power supply section and rebuilt it Frank Sinatra style (my way) I have come to think PS especially with silicon rectifier(s) are too definate. (More on off then gentle rise and fall) Being a mechanic by profession I decided it needed some more springs. A bit of give here and there if you will. This is a transformerless (save for the heater 12v transformer) and is half wave. It has a keyed wall plug for safety. Now coming in the high side AC line feeds a 22ohm 5 watt wirewound resistor. That feeds the silicon diode. Other AC line is grounded to chassis. Next is the Pi network. No choke but a1 k 5 watt resistor between the input and output cap + ends. - ends grounded. from there a 500 ohm resistor feeds the RF choke supplying the regen section of the radio. The audio stage plate is fed through another 1 k resistor with a 40uf cap across it to ground. I was pleasantly surprised. No hum. You have to listen hard for it and the radio works nicely now. I like it. In case you might think it was just the caps they were in it before. The resistors (springs) are the basic difference. (Resistors are springs and caps are shocks here) Anyway tis now a joy to run.

Hi, Don,

Congrats on fixing the hum! Silicon diodes can definitely create hum in a regen because the switching transients can create harmonics all the way into the HF range. Another trick that usually works is to bypass each diode in the rectifier (be it half-wave, full-wave, bridge, voltage multiplier, or whatever) with a cap, usually a disk ceramic, say 0.005uF at 1KV.

You are definitely thinking right - you have essentially made an RC filter for RF generated by the diodes. Strictly speaking though, the mechanical analogue of the resistor is the shock absorber ("dashpot"), and the mechanical analog of a capacitor is the spring, not vice-versa. Also, for completeness, the mechanical analog of an inductor is mass. See, for example, page 2 of:

http://sites.fas.harvard.edu/~es145/notes/es145_lecture3.pdf

Of course! It says so right in my post. And I checked for ground currents as well something I learned to do when restoring 3 phase 600 volt machine shop equipment with unknown histories. (Made my own 3 phase in house BTW)Cannot get a shock. Keyed plug and GFI as well. I'll be honest I use a lot of these. It isn't rocket sceince to hook them up properly and I always double check.

I dont agree with that but I guess it doesnt matter. The resistor allows the wiggle, the capacitor soaks up the peaks and fills the valleys.(smooths out the bumps) Anyway it works for me and the radio is dead quiet so I am happy.

Yeah, Mike; I had it in a Linear Systems Analysis course when I started working on a MSEE, I never completed the MSEE - my wife had twins and that was the end of that! I liked the course. We all had to choose a project to model - mine was a piezoelectric quartz crystal!

Don,

Think of it this way - the shock absorber converts mechanical energy to heat, just as the resistor does with electrical energy. And the spring stores mechanical energy, as the capacitor stores electrical energy.

Tonight on 3625kc VE3AWA made contact on AM phone with VE3LYX. Band conditions were terrible with a very high noise floor but despite that Lou was able to get through. I recorded it with my shack tape recorder and tried to rerecord it to this computer. It did not come through well. I should have just taken the computer down stairs and used it straight up. I was unable to return tonight but we will try again as Lou has heard me before. It will take a bit of adjustment to find the right spacing but the conversation was certainly understandable. It is amazing that with this method the signal could be heard and understood under such poor conditions. I don't know the power out but i assume his input is around 5 watts or less. I was listening on an HR10B and it is on a beverage. I told Lou if it was 1919 we would think it was perfect!
Congratulations on a job well done Lou! Or as WC Fields would have said, "Give the man a cigar!"

The loop modulation is very easy and quite effective which is its biggest drawback by far. The HR10B receiver in this shack has received the monicker as the worlds worst shortwave receiver. I was tuned up and listening on a RS DX390 dgital however I had the HR10B close in frequency. The noise level however was unbelievable. I could tell Lou was tuning up but when he began to speak the noise was too bad so I quickly found him on the HR10B because it is on a beverage receiving antenna which KILLS background noise and even though everyones signals were iffy that night here I was able to hear him clearly VE3AWA VE3AWA calling VE3LYX VE3LYX. We are 197 miles apart. I had started a tape recorder running in the far side of the shack when I first fired up so I have it on tape too even though the tape recorder was only in the same room not real close. I have listened to it several times since. It brings a smile. Lou is really a bit shy on phone so he he didn't say much. I understand that having been through it myself last spring when I was able to work a couple of Hams in the Eastern US on phone with my 40M TNT quite easily. It is a bit of shock. Then there is a day or so of grinning as you know you have experienced something that was experienced back in the 1919 and early 1920s. I treid to reply and Lou could hear my carrier but his noise level at s9+ that night made it impossible for him to hear morethen just my carrier and test CW V. because we were on 80M I didn't have my good looper the 40M TNT but had to whip up a quick adapter for my recently built for the BK 80M Hartely. I also having stolen all my 01A for the Three dialer project had a 45 in this rig. It was a bit stubborn but I had it working good on our original frequency 3690 and had tested it 20 minutes previous. when we went to operate our 3690 was busy and we qsyed our exhange to 3625kcs. The 45 was stubborn but i did get it going however noise level ofS9+ is above my TNTs Hartley ability to put a signal there and the fact that he could even hear my carrier on test as I centred on our choosen freq a bonus. As with many things in life Murphys Law raised its head once again for me but that is ok because Lou has heard me on phone on my TNT before anyway. This was Lou's night and he delivered in fine style. He is probably still grinning and pinching himself. We will do it again I am sure and to that end I have retubed the Hartley to its original set up so I can trust it to run when I key it. Now all we need is a quieter night with good prop. ARRL says in their 1920s report contacts as far as 1500 miles have been done with it so we live in hope. IE CQ VE7SL?????? ;>)

What kind of modulation percentages are you guys getting? I once tried "loop" modulation but the percentage was quite low. My carbon microphone's resistance varies by about +/- 30% with loud speech directly into the mike. Is this typical for carbon mikes?

Jon

Subject: Re: [AWA Group] Digest Number 1481

The loop modulation is very easy and quite effective which is its biggest drawback by far. The HR10B receiver in this shack has received the monicker as the worlds worst shortwave receiver. I was tuned up and listening on a RS DX390 dgital however I had the HR10B close in frequency. The noise level however was unbelievable. I could tell Lou was tuning up but when he began to speak the noise was too bad so I quickly found him on the HR10B because it is on a beverage receiving antenna which KILLS background noise and even though everyones signals were iffy that night here I was able to hear him clearly VE3AWA VE3AWA calling VE3LYX VE3LYX. Hi Lou,

Thanks, but no thanks...

When I built a Heising modulator a few years back, I used an ordinary F-1 Bell Telephone mic cartridge for a microphone...worked like a charm, too, adding "wobbulation" to my 245 Hartley...

I had to wrap the steel parts of the mic with tape, though, as I'd get a "bite" out of it, every time it might contact my lip!

Turncoats?! I,ve heard everything now! It is very cool but is mid thirties. I was planning another build today. I started searching for a Candlestick phone. Carbon mic and earpiece with push to talk sort of.
BTW was working on the hartley and tested to see how low I could take it (160m thing) 1888kc and fully tuned. Then I realized I don't have a 160m antenna.

Hi Mike,

Aha...!

Somebody is trying to cash-in on a well-known marque...!

I bought a brand new Presentation here some 30 years ago, directly from Vibroplex: it has the gold-plated cover atop the base---I thought that maybe the really old ones had the entire base gold plated.

Learn something new every day, I guess...!

Thanks, Mike...

10891. Heising looping kathoding

Yahoo group: AWAGroup (2014 — 2016)
Date: 2015-02-06 21:31:16 UTC
From: dulmagedon@...
Topic: 10891 Message: 10891

I found Eddy's comments interesting. I wondered if he left it built and would bring it out to play some dark night. Me and Lou use bakelite mics so we don't get as badly stung. Before Lou showed us the Loop picture I had been playing with Kathode modulation on my TNT and had it working fairly well. I never quit having also a pair of kathode keyed ARC5s and currently have three devices that will mod the kathode in operation. These are the three best working in my opinion but I have morphed through several different designs on the way. Interestingly for me anyway, is the fact that the first one I built for the TNT is among my favourites still working. I have had it on all my kathode keyed rigs and it runs them easily. The last was my bare essentials 50l6 rig and it worked nice there as well. Normally I use a 01A tube in it although I did have a 45 in when testing it on my ARC5s (80M and 160M) So in that vein I had started already this week planing and collecting parts for a dedicated AM pre 29 rig.I was working on it this afternoon and have the pilot 4 pin tube sockets mounted and a 1920s audio transformer from an old Harris chassis liberated and ready to install on the wood chassis so I can use a carbon mic. A I alluded to earlier I am wanting a old candle stick telephone to use as mic stand and to use its old carbon mic. This rig will also be kathode keying so I will be able to be a patriot or a turncoat at a moments notice and would be using my wooden key or my 1920s vibroplex on CW. The Modulator will again use a 01A and the Tx will use a 45 and probably be a Hartley as it is by far my favourite osc to build and run. The modulator circuit will be an exact copy of the one I made since I have rubbed on it and changed it till I was totally happy with its performance. The trick will be to strike the right balance between good modulation (Spelled enuf)and minimal osc disruption. Anyway that is what is happening here.

don

Every morning we get a weird buzzing on 1200KHz AM. It goes on for a couple of hours and interferes with my wife's favorite station on 1210KHz. I'd like to complain to someone but don't know who. It's pointless to complain to the FCC. They'll just tell you there's nothing they can do. It seems to be coming in on the power line. I turned off all my breakers but a transistor redio still picks up the buzz, especially near the service entry.

Not at the moment but I have my brother on a search to find our old Certelecom Lab equipment. We used to have an early one because I made a bunch of traps for Dad once to cure interference on 136 Mc on a marine radio under test and he let me spend a few hours afterwards playing with it.later they got a fancy digital one but Dave says the original is probably stashed in closet somewhere at the lab as it is in the same building it was started in. Here is hoping! There is a ham about 12 miles away who has a new one in his shack and I may ask him what that section of the band looks like. I just picked it up on my digital G8 traveler too when testing another circuit. It never used to be a problem so something has changed.

10904. AWA Amplitude Modulation QSO Party - This Weekend

Yahoo group: AWAGroup (2014 — 2016)
Date: 2015-02-07 21:05:20 UTC
From: Don Buska - The Radio Lab Works
Topic: 10840 Message: 10904

Just another reminder that this is the weekend for the AWA AM QSO Party. As Larry NE1S has already indicated in a prior notification he will be running the AWA callsign W2AN as one of the events flagship stations. I will be running W1HRX (The James Millen Society) callsign as the second flagship station for this event.

Now I need to get busy and clean off the operating tables for the two stations I plan on using this weekend. That should take me up to our starting time at 23:00UTC today.

Hope to work some of you this weekend. As always W1HRX can provide QSL confirmation cards to all worked stations. Our cards are replica's of Jim's original QSL's used in the late 1930's that picture his 1KW AM station rack setup now located at the AWA Museum.

Hi Guys,

Anyone who has ever used a Q-multiplier to "soup-up" the selectivity of a vintage receiver needs no introduction to this item:

http://www.kijiji.ca/v-electronics/belleville/heathkit-q-multiplier/1047350658?enableSearchNavigationFlag=true

It's a tad pricey for what it is, but it surely can be negotiated down by the enterprising (as in "cheap") radio Amateur...!

Hi Mike,

The most I ever paid for one of those---and I own several here, believe me!---is probably $5.00. But the one shown in that ad is truly exceptional in its physical condition, so I guess that alone would make it worth the asking price of fifteen bux...

Let's see now: $15.00 in Canadian dollars is, what, about seventy-five cents U.S. anymore...?! :o)

You have a problem that is becoming more common.? In the search for the cause, You've already done "Step One", by turning off all your breakers.? I'd suggest that you use your transistor radio as a "direction finder".? If the radio has a ferrite rod antenna, it will have a "null" off each end.? If you walk around the area near your home, and turn the radio for a null in the noise, the source will be at either end of the radio.? Do the same at several locations, and the source will be at the point where all readings intersect.? If the noise is being coupled into the power line, this technique may not work, as it won't have a point-source.? You can also try the "hotter - colder" approach.? Walk around the area and see if the noise gets stronger at one specific spot.? Hold the radio with the rod antenna pointing up and down, so it won't be directional.

?

Hope this helps!

Oh you will get it. Takes a bit to get the spacing right and the listener has to be right on top of you. Close doesn't cut it. We need to practice more. And you need a good night. I can't get to 1885 on the hartley. Closest I can get in full tune is 1888. And since I have never had a 160M contact ever on any rig so I decided to save the electrons. The fact you could be heard is not insignificate considering power distance and mode. If they were shouting back to you on 2 watts or so you wud have heard zip. I have a ARC on 160M AM and with its tuner designed for a too short wire it would probably work but I wasn't up to playing radio today.

10928. Hollow-state negative voltage regulator?

Yahoo group: AWAGroup (2014 — 2016)
Date: 2015-02-10 19:23:51 UTC
From: Larry Szendrei
Topic: 10928 Message: 10928

Is anyone aware of a vacuum-tube design for a feedback-controlled variable negative voltage regulator?

IOW, something that takes an unregulated voltage that is negative WRT ground and drops it to a variable, regulated less-negative voltage WRT ground? It does not need to source much current - say, only 5-10 mA - but should be able to maintain regulation when the "load" is sourcing current up to 30 mA or so. The application is a grid bias supply for a stage that runs into grid current.

A Google search for "vacuum tube negative voltage regulator circuit" only produced the typical positive voltage regulators.

I know, pretty easy to do in solid-state with PNP's or p-channel FETs, but this will be used in an all-tube project.

Thanks in advance for any leads,
-Larry/NE1S

Sure, that's easy - but I need a variable-voltage, feedback-controlled
regulator. I can't be constrained by the available regulator-tube voltages.

Thanks for the response, though.

Hi Larry,

I'm afraid all I can tell you right now is that it can be done! Some eons ago I built such a supply for bias in a VHF QRO amplifier. It was an adjustable, well regulated bias supply. I *think* I found the design in an old ARRL Handbook, but I'm not sure. If I did, 1952 would be a good guess on the year. Unfortunately (for both of us) I no longer have that handbook so I can't check.

I don't recall the adjustment range of the supply. I was probably looking for something around -50 to -60 volts at the time. It worked just fine.

Larry –

It seems you may be able to experiment with a triode connected such that the input to the cathode is your unregulated negative voltage and the grid input would come from the center tap of a pot which is across a VR tube also across the input. Then, the negative output would be off of the plate. Like I said, you would need to experiment, but, I think it is a simple solution for what you need. Depending on the regulation you need, you can also play with feedback from the plate back to the common grid circuit. Similar to a SS pass transistor case. 73 – Mike

Well, I'm an AMer...if that is what it is.

On 3615, Don (200 mi.) and Jim (11 mi.) both reported that the audio was readable and fidelity adequate to identify the speaker. Later I changed the filament voltage from AC to DC (Type 10) for an improved T carrier signal. Because the filament battery is less then "stiff", Jim could not zero in on and chase my signal at the same time. Don tho, being an ol' hand, could and reported the audio had more "highs". "Sounds more like you."

Don suggested there be a Loop Net.

Thank you again, Don & Jim. Cards in the mail tomorrow. Was anyone else frequency?

73, Lou

Was a blast to hear your voice once again. It was better this time then the last test and clear when you switched to DC heaters. Sounded like "you"
I was listening on a Trio 9R-59 hooked to a beverage. AM mode without Q multi engaged. Band was not real strong but signal was copyable. As an old 20M dxer I have worked harder to hear . Copy was not difficult.Difference between AC and Dc heater power was noticable. On a good night we could have a Loop net.
Congrats. Ya dun good!

Small museum, large collection.

The 8th May this year is the 70th anniversary of VE Day

The Military Wireless Museum in Kidderminster, West Midlands, will be open and will be operating with numerous sets available, using the clubs call of GB0MWM.

Visitors are welcome to operate the museum radio's or bring along things to try.

cheers, Ben. G4BXD

Larry –

This is about what I was attempting to talk about but in reverse. Regardless, you can use this exact circuit, as long as the input is isolated from ground and then just ground the positive output and take the negative output from the same place where the negative input goes, or, common. Relative to the grounded positive output, you will have a negative regulator that is adjustable.

This circuit is a little more complex and offers better regulation due to the feedback amp, in my opinion.

It seems you may be able to experiment with a triode connected such that the input to the cathode is your unregulated negative voltage and the grid input would come from the center tap of a pot which is across a VR tube also across the input. Then, the negative output would be off of the plate. Like I said, you would need to experiment, but, I think it is a simple solution for what you need. Depending on the regulation you need, you can also play with feedback from the plate back to the common grid circuit. Similar to a SS pass transistor case. 73 – Mike

Subject: [AWA Group] Hollow-state negative voltage regulator?

Is anyone aware of a vacuum-tube design for a feedback-controlled variable negative voltage regulator?

IOW, something that takes an unregulated voltage that is negative WRT ground and drops it to a variable, regulated less-negative voltage WRT ground? It does not need to source much current - say, only 5-10 mA - but should be able to maintain regulation when the "load" is sourcing current up to 30 mA or so. The application is a grid bias supply for a stage that runs into grid current.

A Google search for "vacuum tube negative voltage regulator circuit" only produced the typical positive voltage regulators.

I know, pretty easy to do in solid-state with PNP's or p-channel FETs, but this will be used in an all-tube project.

Thanks in advance for any leads,
-Larry/NE1S

Thanks, Mike. You as well as Richard, AA1P on the Glowbugs list essentially made the same suggestion, and I played with the schematic and figured it out yesterday. I'm just now catching up to respond to those that helped with suggestions.

In my case the positive side of the unregulated negative voltage supply is grounded and must remain so. So, in this case the positive input of both the circuits below is tied to ground, and the negative regulated output is taken from the cathode of the pass tube. This references the regulated output to ground not directly but through the unregulated supply, which is not great, but probably would work well enough. I agree the circuit with the error amplifier would provide better regulation; I have used it may times, but on positive supplies wrt ground. In my application the regulation could be improved by referencing the cathode of the error amplifier to the ground (through a string of Zeners or VR tube(s) rather than to the unregulated negative supply rail. There is a a negative regulated supply circuit that does this, for example, on P241 of the 1950 ARRL handbook, which I went looking for at Paul N1BUG's suggestion.

In the end I think I found an acceptable solution very similar to what Mike K6RRE suggested on Glowbugs using a triode as shunt regulator, and similar to your first schematic below. If you have a 1944 ARRL Handbook, see page 168. Very simple, and the bias supply doesn't source much current, but the shunt tube sucks it up when the "load" is delivering current.

73, and thanks for the help!

Thanks again, Mike!

I used a similar (but not identical) circuit may years ago in a transmitter. In this case regulation was desirable but not the primary consideration. I had a large negative voltage I wanted to drop, and had an unused half of a 6080 low-mu triode already on the project chassis. So I hooked the anode of a -75V 5W Zener to the negative supply terminal the cathode of the Zener to the cathode of the 6080 triode, the anode of the 6080 triode to the load, with the 6080 grid connected to the wiper of a pot connected between the 6080 anode and Zener anode/negative supply node.

I figured there would be some modicum of voltage regulation from the negative feedback of the 6080 anode to grid through the pot. It worked like a charm for my purpose, although I never characterized its ability to regulate the voltage. I just set the output voltage with the pot under quiescent conditions, and forgot about it. That was about 20 years ago, and the transmitter works fine to this day (I was just using it last night!)

Unfortunately, IMHO, none of the 3 ckts depicted would be able to "sink" current from the load (control grids of the 4-65s). Therefore, the bias voltage will soar more negative, when 4-65 grid current begins to flow.
A shunt type regulator will do what Larry requires.

Actually, Ron, the way I see it the first two circuits would! In my application they are shunt regulators, as the tube is directly across the load/current source. The 2nd circuit, the one with the error amplifier, would also "correct for" any change in voltage at the cathode due to current sourced from the "load."

10948. 630m Crossband Saturday Night

Yahoo group: AWAGroup (2014 — 2016)
Date: 2015-02-12 00:05:16 UTC
From: Steve
Topic: 10928 Message: 10948

Since getting the new 630m band (472-479KHz) here in Canada, one of my favorite ways of promoting interest in the new band has been 'crossband' activity ... that is, transmitting on 630m while the other stations transmit on a predetermined announced HF (QSX) frequency, usually on 80 or 160m. There are many amateurs in the U.S. who are interested in getting the band as well as many Canadians that are interested in getting on the band and the crossband activity usually generates a lot of interest.

The last time this was done, over a dozen stations (from W3, W5 to local) were worked via the crossband mode. A summary of that evening is posted here:

http://ve7sl.blogspot.ca/2014/11/630m-crossband-summary.html

Both myself and John, VE7BDQ, have enjoyed making other crossband contacts this past winter and will once again be soliciting crossbanders this coming Saturday evening.

Our plan is to operate from 0200Z through 0700Z, (1800-2300 PST Saturday). Beginning at the top of the hour, we will both be calling CQ on CW and listening for any callers on HF. CQ's will continue until there are no more callers and will begin again at the next top of hour time slot. This should allow for a wide variation in propagation and the possibility of eastern contacts as the evening progresses.

The frequencies will be:

a.. VE7SL TX 473.00KHz QSX (listening) 1808KHz (160m) and 3535KHz (80m)
a.. VE7BDQ TX 474.00KHz QSX (listening) 1813KHz (160m)
It is hoped that as many stations as possible will give a listen for us and be able to call on one of the HF QSX frequencies. Both John and myself will be running at the maximum allowable eirp for the duration of the activity.

If you have not had a look for any 630m stations, hopefully you will take the opportunity this coming Saturday night ... you really do not need any special antennas for receiving on 630m. Many of the stations that I have worked on crossband have been using HF dipoles for low-noise reception.

Please feel free to post this message to other groups as well...and, watch the blog for further updates.

See you Saturday I hope!

Steve / VE7SL

This was my first HB rig built in 1968 or '69. For the winter of '70, it was my station transmitter (80) along with an Eddystone 750 RX. It has sat neglected in a box these years.

This afternoon I dug it out of storage. After dusting it off, re-sweating a few suspect finishing nail wire tie points and measuring the filtre caps (OK), I fired it up very slowly without a pop or a bang. As well, all voltages measured as they should.

Without an antenna line series variable, the output is 3Ws. Series cap. loaded, 4Ws output. As remembered, the tone is a bit "wispy", the amount of which depending on crystal used.

Originally it had the pill bottle/trimmer cap tank, but at the first press of the key the trimmer arched. Al Brown, VE3DSM/VE3AL(SK) gave me the B&W Baby and variable as replacements.
Anyone here build one of these in the original fashion?

Recently, Harry, VE3GRO sed that loop modulation and XTAL control do not mix.
Harry seems to be right...

73,
-Larry/NE1S

-------- Forwarded Message --------

Big, I mean really BIG, article in the February 11, 2015 RadioWorld Magazine.

You won't want to miss this story about the 250kW Collins transmitter which was saved from the scrap yard by the combined efforts of the AWA (Antique Radio Association - http://www.antiquewireless.org/) and the Collins CCA (Collins Collector Association - http://www.collinsradio.com/)

Online version - http://www.radioworld.com/article/awa-saves-a-piece-of-delano-station/274511

This transmitter was rescued from the 'Voice of America Delano California Shortwave Station'
with the rescue crew given only about one week to remove it. A massive undertaking.

It will be on display in the new AWA Museum located in Bloomfield, NY.

You can help fund and be a part of this project by joining the Collins CCA, by joining the AWA, or...

Please consider a donation, no matter the size, to support our efforts.

Very FB, Lou.

But I see know theoretical reason why loop modulation shouldn't work with XTAL-control - you'll just get (a lot) less FM-ing ("wobulation").

As I understand it, loop modulation should "work" (such as it does) wherever there is a tank circuit with energy than can be coupled to the carbon mike. Would like to discuss this with Harry - maybe I'll learn something.

10955. Re: [AWA Group] Jim & Lou's B-E Transmitter

Yahoo group: AWAGroup (2014 — 2016)
Date: 2015-02-13 14:15:19 UTC
From: Niel - W0VLZ
Topic: 10951 Message: 10955

Isn't part of the reason for the success of loop modulation that
FMing/Wobulation?

(FMing/Wobulation with slope detection in the receiver) plus (any
amplitude modulation introduced by energy absorbed by the carbon mike)
=> the demodulated signal we can hear. Without the FM/Wobulation part
the signal audio from the receiver and the perceived modulation
percentage would be a lot less.

An FM signal through a true FM detector (rather than slope detection) is
much more immune to noise than an pure AM signal and AM detector. I
wonder if an AM detector + noise blanker and slope detection is any
better at noise handling than a straight AM detector with noise blanker
and pure AM signal.

73,
Niel - W0VLZ
(now back from VK and P2 land)

Lou: You'll have to forward this message to Larry and the group. I wasn't allowed to. 73, Harry

---

Hi Larry, Lou and All...

I've been wrong before, but I think I'm right on this one. It isn't that Lou's mike and loop are absorbing RF from the coil that creates the AM modulation. This effect would be negligible whether the rig were self-controlled or crystal-controlled. It works on our 1929 Hartleys and TNTs because this setup results in FM. On the receiving end, the FM signal moves back and forth across the sloped passbands of our receivers and there—in our receivers—creates the AM which eventually comes out our speakers. This is called slope detection. Check out this tutorial:

http://www.radio-electronics.com/info/rf-technology-design/fm-reception/fm-slope-detector-discriminator.php

Slope detection was of some interest in the late 40s and early 50s before SSB became popular. It was easy to FM-modulate a VFO with a handful of parts, and the sloped passbands of receivers of the day found it easy to convert the FM to AM. Nowadays, receivers have passbands with very steep sides. Great for cutting down on QRM, but no slope to convert the FM to AM. Don't expect to hear much of Lou's loop modulation on a Kenwood or Yaesu. But tune in on your old Hallicrafters, National, Collins or TMC, and he'll be there...

A final note. There's one other way to FM our 1929 Hartleys and TNTs and get our voices on the air. Shout at your tank coil. Really. Try it with someone listening on a receiver in another room. You'll be amazed...

I am going to ignore all the nonsense about loop wobbulation since it is based on prejudice and not knowledge or experience except to remind us that some here (prime instigators of this wobbulate opinion)were also unable to plate modulate similar transmitters without wobbulating and no one is reffering to plate modulation as wobbulation.(neither did I make a career of mocking him but understood how difficult it can be to make an early Power osc behave) I have a rock bound 3 stage loop modded TX however it is solid state and doesnt fit here. Having spent a career in research and development in another field I long ago learned popular opinion has nothing to to with facts or science. I also have a B-E on AM or had you all forgotten.
NOW
, Last month someone mentioned a pair of MK19s on kijjiji. Thank you I completed the purchase and they are being truck south as we speak. I will have to make cables to mate with my PSs but have done that before. I have no connectors but will make them I guess. I hope the sets , at least one will find a home in my shack
and will drive my 811A linear sufficiently that I can use it on the air occasionally as I do my ARC5s. I may part with the other once I am sure all is well. Turned out the owner was a friend and collegue of a couple we have lunch with every sunday. Both of them being in Guelph at the time. Thanks to who ever gave us the heads up. Delivery is supposed to be in the morning.

Lou - I wonder if you might get more output from your carbon microphone with a little positive (battery) voltage on it as is usually the case with carbon mikes. If so, perhaps the modulation % might increase as well.

Don, If you are referring to my post you are prejudging me. I HAVE experimented with loop modulation, but I also like to have a theoretical understanding of why things work. Why should you take offense to that? I wish you wouldn't. I think the all stuff you're playing with is great and enjoy reading about your "exploits."

As far as the "wobbulation" term goes, I'm not using the term as a derogatory one, just as a somewhat humorous term describing incidental FM on an AM signal. And when I did experiment with loop-modulation my Hartley (which is quite clean and stable with plate modulation*) I had no perceivable AM, only FM. I know this by looking at the modulation envelope display in the scope (there was none, only a carrier) and I could not hear any modulation with a monitor receiver tuned directly on frequency, but I heard plenty when I was tuned either high or low off-frequency. That says "FM" to me, as that's how you slope-detect an FM signal. These were my results, I am not saying yours are the same, because unfortunately I have never heard yours.

*I have posted sound files of my plate-modulated Harley signal here before, with and without a beat signal, the latter which shows that the FM component, while present, is barely detectable.

Come on, let's be friends!

I don't know, but I believe it was applied to output tanks of MOPA rigs as well as oscillators. It's called "absorption modulation) because the carbon mike element absorbs energy from the tank circuit, and it does so at an audio rate when the mike is spoken into. Thus, it should generate some AM, although I don't think very high percentages of modulation can be achieved except at very low power. Of course, with an oscillator, FM is also produced, and from my attempts, the FM dominated and AM wasn't detectable.

Yep, that was my experience. I should try loop-modulating the output tank of a multi-stage rig and see what I get.

Steve -

I am not sure that will help. As you know, a carbon mike is nothing more than a transducer whose output resistance varies with sound pressure. In loop modulation, you are coupling what is essentially an almost shorted turn to the output tank. If it was totally shorted, the coupled loop, the maximum amount of energy will be dissipated within the loop, taking that amount away from the total output. Of course, with non-crystal controlled rigs, this will also shift the output frequency. If the loop is left open, then nothing will happen, other than what the static parasitic capacitance effects may introduce. When the carbon mike is introduced, you are someplace between the shorted and the open case, and, changing that amount by your speech. Inserting a battery will not change anything, as it will just act like a short to the RF (like inserting a piece of wire in the loop), however, like you say, it will also bias the mike, which in this case I am not sure is a good idea. Additionally, the battery voltage, plus the RF power, will probably make the mike hotter. I believe what would help the most id to find a carbon mike that changes the most resistance during speech, with high volumes creating the lowest possible resistance, hence maximum absorption.

Thanks MIke. I know little about carbon microphones but had thought perhaps by getting more current flowing in the mike circuit that it would produce a stronger field current in the loop....'twer just a guess :-)

Yes, I agree with all that, Mike.

I might add that since a carbon mike is nothing more than a carbon resistor whose resistance changes with sound pressure, the carbon mike can be thought of as a dummy load when coupled to a tank coil via a turn or two of coil. Talking into the mike varies the loading of RF energy into the mike at an audio rate, thus the amount of energy absorbed by the mike, hence the term "absorption modulation.

A DC bias current through the mike is only necessary when you are trying to produce an audio signal voltage that can then be amplified electronically.

10970. 630m Crossband Tonight

Yahoo group: AWAGroup (2014 — 2016)
Date: 2015-02-14 17:40:24 UTC
From: Steve
Topic: 10970 Message: 10970

Just a reminder about the 630m crossband activity night this evening. There have been two updates to the plan:

VE7SL will start one hour later than originally planned and
John, VE7BDQ, will be listening on both 160m and 80m
QSX frequencies for callers.

The frequencies will be:

VE7SL TX 473.00KHz; QSX (listening) 1808KHz (160m) and 3535KHz (80m)

VE7BDQ TX 474.00KHz; QSX (listening) 1813KHz (160m) and 3532KHz (80m)

John will operate from 0200Z (1800 PST) - 0700Z (2300 PST) while I will start one hour later.

Both stations will call several CQs at the top of each
hour segment, at full eirp, and listen for any callers on the specified calling frequencies.

The last time this was done, transcontinental contacts were
completed ... hopefully conditions will continue to co-operate
and propagation will be good tonight.

We both hope to work you tonight!

I have been listening to AM radio while at the GYM. No
kidding, it was 50
minutes of commercials interrupted by occasional sports and
weather and almost
always the sports and weather lead into another commercial!
They even
interrupted commercials for commercials! I remember as a
teenager listening for
hours to the likes of KDKA, WLS, WBZ, and of course 77 WABC
but I don’t remember
such commercialism!

Sorry! I guess I am just old!
Ron K3PID

Hi
Ron,
Yes, how very true---and they want
to kill commercial-free CBC Canada radio here, & replace
it with all that commercialized drivel. They have
NO idea what they're wishing for,
but may well get it, in their lack of
care...

Hi Ron,

I doubt if you're in range---except, maybe, at night time---but you might try "Zoomer" radio, from Toronto, on AM 740-KHz...

It's the flag ship station of the legendary Canadian broadcaster Moses Znaimer, & it caters specifically to us of the more "...mature crowd"(!).

I think you'd like it: on Saturdays they feature a "...legends of stardom" segment, where the host chronicles the early years of 3 greats: yesterday those ranks included Frank Sinatra, & Elvis Presley. They feature some of the more early, obscure songs of those featured, as well...

Good radio, no matter...!

Thanks Eddy, I'll give a listen. We have a local station that is along the same lines and they even play request. As for the "big AM guns" like WCCO, I understand that the economics require commercials but when there is no significant "other" content it may have gone too far! As Ron pointed out the FM spectrum is pretty much shot as well...

Hi Eddy,
Thank you for the tips! Note, however, that we are talking about the same station. CFZM are the official call letters of good old "AM 740"/"Zoomer redio".
Fortunately, I can often hear it well, down here, but with QSB--On some occasions, beginning well before sundown, during winter afternoons. Co-channel interference from an Oklahoma station can readily be eliminated, if I able to use a rx that has a loop antenna.
Zoomer Radio is also available via streaming audio, on the internet.
My favorite program is Sat Night Bandstand, and I also enjoy some of the old time radio shows.
I will make a point of looking for that Sat afternoon show, Eddy!
Thanks & vy 73 de Ron

PS; I hope that this note is understandable--I have a serious dose of flu & I am using meds.

Hi Ron,

Small world, isn't it...?!

Oh well. The only thing that might make Zoomer radio competitive with the CBC, would be if there were no commercials on it...! Not likely to happen, though...

Hope you might get over your cold / flu there soon: I sometimes have "understandability" issues here, too---and I'm not even on any flu medications...! Hi Hi

AWAGroupHello Eddie and others,
Just a FYI: I'm a big fan of "Zoomer Radio" and listen to AM 740 whenever possible here in the Philadelphia,Pennsylvania area. I usually have a 5x5 to S9+20 over copy on the station. They play music that is more attuned to our age group, that we remember from our childhood etc. It is mt favorite broadcast radio station on the AM or FM dial! I listen to it on everything from a ruby red Zenith "Royal 500" transistor portable that I own to a 1921 Colin B. Kennedy model 110 Universal with a Western Electric model 10D "Loudspeaking Unit" horn attached to it.

I like the variety in shows they offer as well as some of the political commentary interjected from time to time from our good neighbors to the north! If you haven't listened to it , give it a try sometime. I particularly like to listen to it whilist sniffing solder fumes when doing a restoration project. If I sniff those fumes without a project at hand I get too high - HI!

Mod-U-later,
Joe Cro N3IBX

Hi Roger,

Just like I remember the excitement & wonder of shortwave listening back when I first got my 3rd hand S-77A in 1969: the toll of Big Ben on the BBC broadcasts, the triumphant horns blaring from Radio Tirana, the "Yankee Doodle Dandy" theme from the VOA, etc. etc. etc.

Now all I ever hear is Radio Peking, right-wing political diatribes, & religious stations.

I scored the pair of No 19 wireless sets mentioned here after no one else wanted them. They arrived. One is a MKII Canadian built by Northern Electric in Montreal and the other is a MKIII with no case and the Tx output tubes missing (A set an 807 and B set a 6v6) A and B refers to the A being the HF set 2 to 8 mc in two bands and B set a 235mcs VHF low power rig. (Maybe future 220Mc AM rig) The second uncased set was pretty ruogh looking and looked like it had been in water but closer inspection revealed it was very superficial and only on the chassis outside. Inside was spotless so I treated it to a rough sand and a coating of molassess on the offending rust to see if it will come clean. Molasses is sometimes used in antique engine recoverrys for severely rusted parts. I have the pinouts and I have a vibrator 12volt battery supply so I may get brave and power up the "good" sets recvr today. Need 12volts and 275v approx which the vibrator supply has. They are not a pretty set and I am not real big on the dual language lettering (Russian and English) as they were made in Canada for the lend lease program during the "big one" I will probably tape the Russian over. I am sure I wont be the first to do so. Anyway for those not familiar these are transceivers of low power , around 8 watts I think AM (actual grid modulated)(and also MCW and CW on the HF side only) which I think might be enough to drive my HB twin 811A linear into a more reasonable power range. Maybe 20 or 30 watts plus. Wow!
The damaged radio may get a 6146 in place of its missing 807. At least for a trysee with a HB adapter socket. What could that heurt? The good set has a very low serial number so is probably well before 1941. Also being a Canadian MkII production is early anyway.

I always liked my 19 set and had a lot of fun and many QSOs with it. Growing up in Communist Hungary, I thought the Cyrillic writing on it was neat. I also have a lot of German WWII radios. Should I white out all of the labeling because of Hitler? I found that people in general are nice all over the world, with of course exceptions, but, it is the leaders and their agenda that create hate and turmoil. I remember even in Hungary as a young child when I used to walk by some of the Russian barracks, the Russian soldiers were always nice to me (gave me fruits or even candy) and the other kids. The poor bastards had families and kids of their own, and here they were in Hungary because they were told to be.

I don't dislike the people. I speak several languages although Russian isnt one of them. However in your case I can see it would be fine. Most of my HBs are labeled "auf Deutsch." Otherwise Canadian English. Lots of folks would be offended by the Deutsch too but I understand that. The Russian means not that same to me. In fact nothing so I would prefer it wasn't there. My radio, my boat and I am captain.
Do you still have a No 19 set? Did you run it barefoot or with an amp?

Don –

Yes, I still have it, however it is down in the basement. I have the complete unit including the power supply the original headsets and microphone and control boxes and so on. I just used to run it barefoot. It only puts out about 2 to 3 watts on AM, but, I was able to work all over with it. It is a fun rig to use once one gets used to it.

I can still understand and speak Hungarian, but, not well. I was 11 when we came here and lost a year of school because I could not speak English. I did have 2 years of mandatory Russian in school there, but, I do not remember any of it. As kids, our contribution to the revolution was to burn our Russian books, HI. 73 – Mike

I am happy to report the receiver works very well. In fact makes my HR10B hide in a corner. I will try the TX tomorrow probably on 1/2 power since I have that easily available off my old vibrator supply. I wonder why an 807 is so low in output. I guess power was not the main goal. I have several carbon mics. Is that right for R/T?
I dont know if 3 watts will push my linear enough or not but I guess there is only one way to find out. Pye Connector has been changed on A set for an automotive areil connector. Which I just happen to have.
My family line had left Germany in 1709 for Ireland then USA 1760,then Canada in 1784. On a trip there(Germany) in 2000 I found the original family still there (Dolmetsch) When I got home I wrote them all from all the addresses I could find. Got an invite to the family reunon in Schwabenland and a warning that only a couple of young ones spoke English. I had 6 months to learn and it came hard at first then like a flood. Once I m around folks who only speak it I am fine now. Did an race engine for a German National living in France (See Nascar Returns to Lemans Blog) The whole conversation both business and technical was conducted in German with no hic ups so I am ok I guess. I am there almost once a year although with my fractured spine recovery I suspect I will skip this year. French I picked up living and working in Montreal as a teenager. It is much harder for me then German (which seemed to be preinstalled)but I can function there and in France as well even though Canadian French is as it was in 1600s so I do get a few smiles there in France but they still understand. Never regretted learning other tongues. It has served me well. Dutch or NL I can read without error probably because of my German and English but I do not speak it. I can't seem to get enough spit in my mouth to say the words right. My Mom was by the way also German descent and her dad of Swiss descent both 3rd generation . She was raised near Berlin Ontario now known as Kitchener. Just for the record both my Mom and my Dad served proudly in the RCAF lest there be any misunderstandings.

Mike –

What are you plug it into? A carbon mike, in majority of circuits will have to have DC on it, as the mike itself is just a variable resistor that has a resistance proportional to your audio. An electret mike also needs a bias, and often there is a battery installed in the mike itself. I have never seen a David Clark headset with a carbon mike. Tell us more. 73 – Mike

You have an interesting family history, Don. My Dad's family originally came from southern Germany and Switzerland. They claimed to be Dutch, probably because during the war it wasn't cool to say you were Deutsch. Some of my Mom's ancestors came from the Island of St. Helena, others from the Appalachians. The end result is that they settled in Hawaii. This has little to do with radio other that the fact that Hawaii was a great place to pick up SW. Lately there's so much static that the fun is fading fast

11008. Electret Mic

Yahoo group: AWAGroup (2014 — 2016)
Date: 2015-02-18 23:53:09 UTC
From: Michael Bittner
Topic: 11008 Message: 11008

The headset with the carbon mic is a David Clark H10-10 and I last used it in an ancient Bertea VHF aircraft transceiver. I assume the H10-10 will work in any tube-type transmitter with a bias supply and a mic-to-grid step-up transformer.

The one with the electret mic is an H10-13.4. I see these are retailing for up to $300 on eBay, so I couldn't pass up one in perfect cosmetic condition offered for $10. I have checked its phones and they work perfectly on a 300 Ohm audio output.

I've goggled electret mics and see that most of them have a built-in transistor amplifier. Although I've found the specs for the H10-10.34, I haven't found any information on its specific circuit or direct interchangeability with the H10-10. In any case, I see no provision for a built-in battery.

11011. Hallicrafters SX-100 meter

Yahoo group: AWAGroup (2014 — 2016)

Hi guys:

I have been restoring a Hallicrafters SX-100 receiver that I rescued out of a barn in Klamath Falls, Oregon. As of this afternoon, IT LIIIIIVES!! I see it still is in bad need of an alignment and I think the filter caps are a bit soft but...

The meter needs replacement. It took a direct hit in the faceplate and the movement is gunched. I know where I can get a replacement for $40 + shipping but being retired I would like to get one for less or a fair trade. Let me know if you hear of anything.

☐

Yes. Don't think I'd want to be any place else right now.

Leonard

☐

You have an interesting family history, Don. My Dad's family originally came from southern Germany and Switzerland. They claimed to be Dutch, probably because during the war it wasn't cool to say you were Deutsch. Some of my Mom's ancestors came from the Island of St. Helena, others from the Appalachians. The end result is that they settled in Hawaii. This has little to do with radio other that the fact that Hawaii was a great place to pick up SW. Lately there's so much static that the fun is fading fast

I am happy to report the receiver works very well. In fact makes my HR10B hide in a corner. I will try the TX tomorrow probably on 1/2 power since I have that easily available off my old vibrator supply. I wonder why an 807 is so low in output. I guess power was not the main goal. I have several carbon mics. Is that right for R/T?
I dont know if 3 watts will push my linear enough or not but I guess there is only one way to find out. Pye Connector has been changed on A set for an automotive areil connector. Which I just happen to have.
My family line had left Germany in 1709 for Ireland then USA 1760,then Canada in 1784. On a trip there(Germany) in 2000 I found the original family still there (Dolmetsch) When I got home I wrote them all from all the addresses I could find. Got an invite to the family reunon in Schwabenland and a warning that only a couple of young ones spoke English. I had 6 months to learn and it came hard at first then like a flood. Once I m around folks who only speak it I am fine now. Did an race engine for a German National living in France (See Nascar Returns to Lemans Blog) The whole conversation both business and technical was conducted in German with no hic ups so I am ok I guess. I am there almost once a year although with my fractured spine recovery I suspect I will skip this year. French I picked up living and working in Montreal as a teenager. It is much harder for me then German (which seemed to be preinstalled)but I can function there and in France as well even though Canadian French is as it was in 1600s so I do get a few smiles there in France but they still understand. Never regretted learning other tongues. It has served me well. Dutch or NL I can read without error probably because of my German and English but I do not speak it. I can't seem to get enough spit in my mouth to say the words right. My Mom was by the way also German descent and her dad of Swiss descent both 3rd generation . She was raised near Berlin Ontario now known as Kitchener. Just for the record both my Mom and my Dad served proudly in the RCAF lest there be any misunderstandings.

I too have picked up some of those headsets pretty cheap. However, I never used any of them, HI. Regardless, it looks like the one with the electret mike is supposed to get its voltage from the set it is connected to. 73 – Mike

☐

The headset with the carbon mic is a David Clark H10-10 and I last used it in an ancient Bertea VHF aircraft transceiver. I assume the H10-10 will work in any tube-type transmitter with a bias supply and a mic-to-grid step-up transformer.

The one with the electret mic is an H10-13.4. I see these are retailing for up to $300 on eBay, so I couldn't pass up one in perfect cosmetic condition offered for $10. I have checked its phones and they work perfectly on a 300 Ohm audio output.
